1 Introduction

Under the Authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA), the U.S. Environmental Protection Agency (EPA) Region 2 Emergency and Remedial Response Division (ERRD) and Weston Solutions, Inc. (WESTON®) have completed an investigation of the St. Croix Alumina (Renaissance Park) site ("the Site") in St. Croix, U.S. Virgin Islands (USVI). The Site is listed in the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) under EPA ID No. VIN000206465. It is a former alumina refinery where bauxite ore processing residues, including red mud and caustic wastewaters, were deposited in on-site disposal areas. The investigation was a combined effort to complete an Expanded Site Inspection (ESI) under the Region V Superfund Technical Assessment and Response Team III (START III) contract and a Removal Assessment (RA) with radiological measurements under the Removal Support Team 2 (RST 2) contract.

The EPA team completed a sampling and screening effort at the Site from September 12-21, 2011. Sample collection efforts and procedures were combined to accommodate the data requirements of both the EPA Remedial and Removal programs. EPA investigated source areas and migration pathways, including ground water contamination, overland flow of red mud from source areas into downslope surface impoundments and other water bodies, and radioactivity levels in source and receptor areas. Waste samples were collected to characterize sources, and background soil samples were collected as reference for comparison. Surface water and sediment samples were collected to evaluate the impact of waste sources to the on-site and off-site overland flow pathway. Ground water samples were collected from existing on-site monitoring wells to characterize ground water quality in specific areas of the Site and evaluate the impact to ground water. Source areas, sampling locations, and residential areas to the north (Bethlehem Village/Profit Hills [a.k.a. Harvey] and Estate Profit [a.k.a. Matthews Charles]) were screened with radiation detection monitors to evaluate radioactivity and potential exposures.

1.1 Site Location

The Site is located within the South Shore Industrial Complex along the south-central coast of St. Croix. The subject property, which consists of several parcels and has a total surface area of approximately 1,250 acres [SCSE, 2002], is currently owned by St. Croix Renaissance Group, LLLP (SCRG). The property is zoned for industrial use and is bordered by the HOVENSA oil refinery on the east; USVI government property (Container Port and Molasses Pier) on the southeast; the Caribbean Sea on the south; a municipal landfill, wastewater treatment plant, racetrack, and Henry E. Rohlsen Airport on the west; and the Bethlehem Village/Profit Hills (a.k.a. Harvey) and Estate Profit (a.k.a. Matthews Charles) residential neighborhoods across a four-lane highway on the north. A Site Location Map and Site Vicinity Map are presented in Figures 1 and 2, respectively.

1.2 Site Description

The Site is a former refinery where bauxite ore was processed for alumina extraction, and residues from the process were deposited on site. The alumina refinery was constructed in the mid-1960s, at which time the on-site ship channel (Alucroix Channel, a.k.a. Krause Lagoon Channel) was dredged and Krause Lagoon was filled. Alumina refining operations began in 1968. The former refinery consisted of administrative offices and other buildings; material storage structures (silos, tanks, and shed); grinding operations; digestion, thickening, filtration, precipitation, and calcination operations; coal- and oil-fired boilers; water desalination units; warehouses; laboratories; maintenance facilities; storm water collection and cooling ponds; bauxite residue (i.e., red mud) disposal areas; recreational areas; and a dock that provides access to the ship channel.

The refinery operated from 1968 through December 2000, with some intervening idle years. SCRG has since begun redevelopment of the Site, including the removal of former refinery tanks and equipment. Currently the Site consists of the dock and ship channel, coal-fired power plant, coal storage area, conveyors, steam-turbine building, desalination units, ethanol dehydration plant (presently inactive), machine shop, maintenance and administration buildings, settling and cooling ponds, and former disposal areas. The former bauxite storage shed also remains for possible future use. In addition, the Diageo rum distillery in the northern portion of the property was constructed in 2009-2010 and began operating in November 2010. Molasses tanks for the distillery are installed in the former location of refinery tanks. Figure 3 shows the Site Layout including major features.

1.3 Site History

Historically, portions of the Site were used for sugar cane production, as evidenced by pre-1900 ruins in the western and northeastern portions of the property, and the subject property had various owners prior to construction of the alumina refinery. In 1937, the property was transferred from West Indian Sugar Factory, Inc. to private ownership. The U.S government took over the property in 1942, and subsequently transferred it to Municipality of St. Croix in 1949. Harvey Aluminum, Inc. (HAI) purchased the property from Government of the Virgin Islands in 1962 and constructed the refinery in the mid-1960s.

Martin Marietta Alumina (MMA) purchased HAI in 1968, the year alumina refining operations began, and continued alumina production at the Site until 1985. Refining operations were discontinued from 1985 to 1989. Virgin Islands Aluminum Company (VIALCO) purchased the property from MMA in 1989, and resumed refining operations from 1989 until 1995. St. Croix Alumina, LLC (SCA), a subsidiary of Aluminum Company of America (ALCOA), purchased the property from VIALCO in 1995, and refining operations were suspended from 1995 to 1998. ALCOA resumed refining operations in 1998, which continued through December 2000. Administrative and maintenance staff for ALCOA remained at the facility until 2002. SCRG

purchased the property from ALCOA in 2002 and initiated efforts to convert it to a mixed use industrial/commercial site.

1.4 Description of Operations and Waste Generation

The former refinery at the Site extracted alumina (Al_2O_3) from bauxite via the Bayer process, which involved crushing and grinding of the ore; dissolution of alumina with caustic soda at high temperatures and pressures; separation and on-site disposal of undigested solid residues (i.e., red mud) from the supernatant; precipitation as alumina hydrate; and washing and calcination of the hydrate to form crystalline alumina. Raw materials used at the facility included bauxite ore, caustic soda, phosphoric acid, sulfuric acid, lime, flocculants, biocides, calcium fluoride, and coal. Bauxite is a naturally occurring, heterogeneous material composed primarily of one or more aluminum hydroxide minerals (principally gibbsite, boehmite, and diaspore) plus various mixtures of silica (SiO_2), iron oxide (Fe_2O_3), titania (TiO_2), aluminosilicates (clay, etc.), and other impurities in trace amounts [USGS, 2001].

The principal waste material generated by bauxite processing at the Site was red mud, which consists primarily of undigested metal oxides that precipitate and settle out of the process solution. The lower-volume, coarser fraction of the residue is referred to as red sand. After separation and removal of excess water, the red mud was mixed with seawater in an attempt to neutralize remaining caustic solution and form less viscous slurry for conveyance to on-site disposal areas [G&M, 1995]. Red mud can contain elevated levels of metals, and the pH of red mud characteristically ranges from 10 to 12 due to the use of caustic soda during the extraction process. Red mud is also known to contain technologically enhanced naturally occurring radioactive material (TENORM), including thorium and uranium. TENORM is naturally occurring radioactive material (NORM) that has been processed in such a manner that its concentration has increased. In the case of the Site, the use of sodium hydroxide to dissolve aluminum oxide from the ore caused lower solubility compounds, including thorium and uranium, to concentrate in the red mud.

From the onset of operations at the Site in 1968 until the early 1970s, the red mud was deposited in the “old red mud ponds”, designated herein as Red Mud Disposal Area B (RMB). This area is located in the center portion of the Site, south of the former refinery (see Figure 3). RMB, which was built on top of a mangrove swamp, covers approximately 81 acres and consisted of seven disposal cells surrounded by perimeter dikes built of carbonate material. The red mud deposited in RMB was approximately 30 percent solids and 70 percent liquids, with the liquids being a mixture of caustic soda and seawater. Excess caustic liquid drained to a dewatering pond in the southeastern part of the source area for recycling and evaporation (this pond was subsequently used for ash disposal, as described below). Based on a review of plant records, an estimated total of 1,229,149 metric tons of red mud were produced at the facility from 1968 to 1972; that waste quantity is attributed to RMB since it was the active waste disposal unit during that timeframe [IST, 2010b]. RMB has since been partially covered with top soil and a limestone capping layer

(i.e., caliche), and some of it has revegetated, but red mud deposits remain exposed throughout the area.

Beginning in the early 1970s, red mud was placed into the “new red mud ponds”, designated herein as Red Mud Disposal Area A (RMA), which covers about 78 acres near the northwest corner of the Site (see Figure 3). A graded toe road that defines the southern limits of RMA forms the crest of the original containment dike constructed prior to disposal of red mud within the area. Waste deposition in RMA began in approximately 1972 after a modification in the separation process enabled the red mud to be pumped out at a greater percent solids concentration (approximately 50 percent). RMA was subdivided into seven cells of diked red mud, some of which reached elevations in excess of 100 feet above mean sea level (MSL) [BCI, 1993]. Red mud was deposited in RMA using a process called “dry stacking”, whereby red mud slurry was pumped into the northern end of each cell and allowed to flow southward by gravity and form a natural slope of 2 to 5 percent. After a drying period of about six months, the residue was bulldozed and compacted. In 1977, the composition of the red mud slurry being deposited in RMA was reported to be approximately 55 percent solids [D&M, 1977]. After 1983, the slurry also included fly ash from the coal-fired boiler. Based on a review of plant records, an estimated total of 4,613,449 metric tons of red mud were produced at the facility from 1973 to 2000; that waste quantity is attributed to RMA since it was the active waste disposal unit at the beginning of 1973 [IST, 2010b]. In addition, approximately 110,000 metric tons of fly ash were placed into RMA. Boreholes completed in 2006 indicated red mud thicknesses of 28 to 60 feet throughout RMA.

Red mud in both on-site disposal areas has been shown to maintain high pH levels and contain elevated levels of arsenic, chromium, mercury, selenium, and vanadium. A 1993 analysis of red mud from both on-site disposal areas indicated the presence of thorium and uranium, however, radioisotope analysis was not conducted [Wagh, 1993].

Other wastes were generated and deposited at the Site as a result of power production. Beginning in 1983, fly ash from the coal-fired boiler was mixed with red mud prior to disposal in RMA, as described above. The bottom ash from the coal-fired boiler was deposited in the former RMB dewatering pond, designated herein as the Ash Disposal Pond (ADP). ADP is located in the approximate center of the subject property and is surrounded on three sides by RMB, as shown in Figure 3. Laboratory analysis of waste samples from ADP has indicated the presence of arsenic, mercury, and selenium.

While the alumina refinery was operational, bauxite ore was stored on site in the large, open air and roofed shed designated herein as the Former Bauxite Storage Area (FBS). FBS is located within the former refinery operational area in the north-central portion of the subject property and west of Alucroix Channel (see Figure 3). When the refinery ceased operation, some unprocessed bauxite was left in the FBS. Alumina and red mud from decommissioning of tanks and other equipment were added to the bauxite pile upon shutdown, and the FBS has also been

used to stage some debris. The FBS shed currently contains a pile that covers approximately 1 acre; the pile consists of a mixture of red mud, alumina, bauxite, and debris, with approximately 8 to 14 inches of residual red mud from decommissioning of equipment covering the surface.

The alumina refinery used approximately 50 million gallons per day of cooling water pumped from Alucroix Channel and subsequently discharged to two ponds constructed in the early 1970s: the 30-acre Upper Cooling Pond (UCP) and the 150-acre Lower Cooling Pond (LCP). These caliche-lined holding basins (i.e., surface impoundments) in the western and southern portions of the property were constructed for cooling and treatment of process water and retention and treatment of storm water [G&M, 1995]. The LCP was initially constructed with twenty outfalls, but silting problems occurred and one primary discharge point to the ship channel has been used since 1981. This outfall is regulated through a Territory Pollution Discharge Elimination System (TPDES) permit issued by Virgin Islands Department of Planning and Natural Resources (VIDPNR) and is designated as Outfall 001A [SSPAI, 2010]. At the time of the EPA investigation in 2011, approximately 2.5 million gallons per day of process water from desalination and storm water flowed through the cooling ponds. The recent cessation of desalination in 2012 has reduced this flow to include only storm water.

1.5 Documented Spills and Releases

There have been various documented petroleum releases at the Site throughout the years and a resultant plume of separate-phase petroleum hydrocarbons exists on the water table in the eastern portion of the Site, north of Alucroix Channel [G&M, 1995; SSPAI, 2010]. About 40 wells have been installed over the years to monitor the plume and remove light non-aqueous phase liquid (LNAPL) and contaminated ground water from the subsurface. Leaks from tanks and associated piping at the Site and the adjacent HOVENSA facility created the plume, which is being remediated under an Administrative Consent Order with EPA. These remedial activities are overseen by the Resource Conservation and Recovery Act (RCRA) Branch of EPA and are not discussed further in this report, except in the context of Site-wide ground water. In addition to the various petroleum spills, there have been other releases at the Site as described below.

During the plant shutdown in 1985, approximately 19 million gallons of spent caustic liquor containing arsenic and chromium and diluted with seawater were pumped into the cooling ponds. The release resulted in a layer of solids (i.e., milky white precipitate) that was subsequently dredged for disposal in RMB. Additional releases of more than 80,000 gallons of plant liquor to the cooling ponds are documented for the period from 1992 to 1994. During the same timeframe, there were releases of fly ash and filtrate to the cooling ponds, sulfuric acid to the ground and to the ship channel, and coal particulate to the ship channel [G&M, 1995].

In September 1998, wind-blown fugitive dust, identified as bauxite by VIDPNR, was deposited onto residential properties located 750 feet north of the Site as a result of Hurricane Georges. Observations by VIDPNR indicated that reddish material had been deposited onto the residential structures and their drinking water cisterns. EPA sampling confirmed that bauxite was in the

cisterns.. VIDPNR issued a Notice of Violation (NOV) to St. Croix Alumina (SCA) for the fugitive dust release, determining that there were no precautionary measures in place to secure the stockpiled bauxite from hurricane winds.

Residents located north of the Site have reported red dust deposition on rooftops, inside cisterns, in outdoor gardens, and on indoor furniture associated with hurricanes and other high wind events.

In November 2001, approximately 25,000 gallons of sulfuric acid spilled from a leaking aboveground tank (T-26-1) to Alucroix Channel. VIDPNR issued an order to SCA requiring it to address this spill. Three monitoring wells (MW-1, MW-2, and MW-3) were installed and sampled by SCA to evaluate the impact of the spill on ground water. Removal of contaminated soil and residual acid was completed in 2002.

In March 2002, a release of red mud from RMA into the sea and shoreline mangrove wetland areas occurred during heavy rainfall. The release occurred after SCA had performed unpermitted grading and recontouring work in RMA. Storm water carrying red mud discharged from RMA, flowed down an unpaved roadway, and entered the drainage ditch that runs along the western boundary of the Site (i.e., the West Ditch). The red mud laden runoff continued along the western boundary of the Site, passed through an 18-inch culvert, and entered a mangrove-lined drainage area. The red mud release then breached beach berms, entered shoreline wetland areas and the sea, and was transported west by shoreline currents. Red mud was observed to be deposited as far as a beach road that runs along the landfill located west of the Site. The release deposited 6 to 10 centimeters (cm) of red mud along the bottom of the drainage path, including 7.5-cm thickness in the deeper part of the mangrove wetland areas. SCA performed berm reinforcement in April 2002, and red mud was removed from the west ditch in June 2002, but subsequent releases in January and April 2003 led to re-accumulation of red mud in the west ditch, including mangrove wetland areas. In September 2003, the west ditch was rerouted from the coastal mangrove area to the LCP.

The persistent erosion problem from RMA continues. The 2006 aerial photograph of the Site and observations made by EPA in June and September 2011 show the migration of red mud across the Site from RMA downslope to the interconnected on-site surface impoundments: the Red Mud Settling Pond (RMS), UCP, and LCP. The aerial photograph and EPA observations also document the erosion and migration of red mud from exposed areas within RMB.

1.6 Previous Investigations

There have been several investigations at the Site throughout the years, including installation of ground water monitoring wells in 1982 and 1995 to evaluate red mud disposal areas. Several efforts in recent years have been conducted to evaluate the waste material that remains on Site, including those events described here.

In 1977, Dames & Moore (D&M) on behalf of MMA completed soil borings to evaluate geotechnical aspects of three areas (RMA, RMB, and Area C [southeast portion of Site]) for feasibility of red mud storage. Geotechnical analyses of red mud samples classified it as inorganic silt of low plasticity with permeability of 5×10^{-6} centimeters per second (cm/s), while semi-quantitative analyses indicated that chromium and vanadium were present in the red mud. A 20-foot-high containment dike of marl was observed at the south end of RMA, while the east and west ends of the dike joined natural high ground at the 40-foot contour. While portions of RMA were found to be directly underlain by the natural marl formation (i.e., Kingshill aquifer), which consists of silty and clayey sand and gravel, RMB and Area C were found to be underlain by highly plastic, silty clay (i.e., Lagoonal Clay) with permeabilities of 10^{-9} to 10^{-6} cm/s [D&M, 1977].

In April 1982, EPA performed a RCRA inspection at the Site. EPA observed two types of process waste being deposited in RMA: red mud (the majority of waste) and wash water used to remove organic matter from the aluminum hydrate crystals in tanks (a washing process that occurred over a 3- to 5-day period every two months). EPA collected samples of both waste materials for EP toxicity metals analysis. The results showed that the red mud exceeded the allowable concentration for mercury, and the wash water exceeded the arsenic and selenium limits [EPA, 1983].

From December 1981 to February 1982, Geraghty and Miller, Inc. (G&M) on behalf of MMA installed twelve monitoring wells (G-1 through G-12) at the Site and collected preliminary ground water samples. The investigation found that the refinery was underlain by strata of moderate to high permeability, ground water flows south toward the channel and sea, and fresh ground water exists under the northern portion of the Site. Elevated levels of pH, fluoride, arsenic, cadmium, and chromium were detected in on-site ground water in the vicinity of the red mud disposal areas [G&M, 1982]. Additional ground water sampling events in July 1983, December 1983, March 1984, June 1984, January 1989, and March 1989 confirmed the elevated levels of pH, fluoride, arsenic, cadmium, and chromium in on-site ground water. G&M reported in 1989 that well G-12 had been destroyed and well G-2 had been damaged [G&M, 1989].

In 1993, a characterization of the Site red mud was conducted on behalf of VIALCO. Elemental analysis of red mud samples from both disposal areas indicated elevated concentrations of silver, arsenic, chromium, selenium, and vanadium. Elemental analysis also indicated elevated concentrations of thorium and uranium in red mud samples from both disposal areas, however, radioisotope analysis was not conducted [Wagh, 1993]. Also in 1993, a geotechnical evaluation of RMA indicated that the red mud water content was 30 to 55%, the dikes consisted of red mud and compacted marl, and the disposal cell elevations ranged from 40 to 110 feet at that time [BCI, 1993]. VIALCO applied for and was granted a Coastal Zone Management (CZM) permit for expansion of RMA in September 1994.

In 1995, G&M on behalf of VIALCO completed an environmental assessment at the Site. G&M installed six additional monitoring wells (GM-13, GM-13D, GM-14, GM-18, GM-19, and GM-22) and collected ground water samples from the new wells and five existing on-site monitoring wells (G-3, G-4, G-7, G-9, and G-11). The results indicated the presence of arsenic and selenium above primary drinking water standards (i.e., Maximum Contaminant Levels [MCL]) in the immediate vicinity of the red mud disposal areas. Secondary drinking water standards for aluminum, pH, chloride, fluoride, total dissolved solids (TDS), and sulfate were also exceeded in on-site ground water. Monitoring well GM-13D, located along the south perimeter of RMA and completed within the underlying limestone aquifer, showed an arsenic concentration of 836 micrograms per liter (µg/L). The 1995 investigation also included collection of solid samples from the cooling ponds; chromium was detected in both cooling ponds and arsenic was detected in the LCP [G&M, 1995].

Beginning in approximately 1994, about 40 wells have been installed in the northern and northeastern sections of the Site to evaluate and remediate the existing petroleum hydrocarbon plume. These wells include VW-1 through VW-38, as well as wells MMX and MM9. There are also several wells on the western edge of the HOVENSA property that are used to monitor and contain the plume. The wells currently included in the semiannual perimeter ground water monitoring program for this plume are G-11, GM-14, VW16, VW22 (dry), VW25, VW27, VW37, and MMX. The sampling program includes petroleum-related contaminants and indicates that these perimeter wells remain outside the influence of the plume [EPA, 1982-2011].

In 2001, Arthur D. Little Inc. (ADLI) completed an environmental due diligence assessment of the Site on behalf of ALCOA. ADLI observed that RMA was uncovered and contained several steep, unvegetated slopes, and reported that it was undergoing restoration. ADLI also reported that bottom ash from the coal-fired boiler was still being disposed of in the unlined settling pond (i.e., ADP) at that time [ADLI, 2001].

In March 2009, EPA collected four surface waste samples (including one environmental duplicate sample) from three locations within RMA. The samples were analyzed for Target Analyte List (TAL) and Toxicity Characteristic Leaching Procedure (TCLP) metals. TAL analyses indicated maximum arsenic, mercury, and vanadium concentrations of 20.2 milligrams per kilogram (mg/kg), 0.32 mg/kg, and 695 mg/kg, respectively. TCLP analyses indicated maximum arsenic, chromium, and selenium concentrations of 24.8 µg/L, 1,010 µg/L, and 96.7 µg/L, respectively, which are below the threshold criteria for characteristic hazardous waste. The TAL analyses indicated the presence of chromium, but the results were considered to be unusable [WESTON, 2009].

In April-May 2010, Integrated Science & Technology, Inc. (IST) on behalf of SCRG completed a subsurface soil and ground water sampling investigation of the RMB and ADP areas. Direct-push borings encountered red mud to depths greater than 24 feet in RMB and black ash to a depth of 15.5 feet in ADP. Other debris, including fabric and black ash, were also encountered

within red mud deposits in the southwest corner of RMB. The Lagoonal Clay was encountered beneath the waste materials throughout the area. Analytical results for the investigation indicated elevated concentrations of arsenic, chromium, mercury, selenium, and vanadium in the waste materials deposited at the Site and in monitoring well GM-22. Elevated levels of arsenic and vanadium were also detected in monitoring well GM-18. The investigation also showed that the deposited red mud waste and associated shallow ground water maintain high pH levels. Inorganic analysis of aqueous samples collected from monitoring well GM-22, believed to represent red mud leachate in RMB above the clay confining layer, indicated arsenic at 5,100 µg/L and a pH of 12.81 [IST, 2010a].

In December 2010, VIDPNR completed a field sampling event at the Site. Soil, sediment, and surface water samples were collected from on- and off-site locations, including the red mud disposal areas, Alucroix Channel, and the cooling ponds. The analytical results indicated elevated concentrations of arsenic, chromium (including hexavalent chromium), mercury, selenium, vanadium, and uranium at on-site locations, including the UCP and red mud disposal areas.

In July 2011, the EPA National Decontamination Team conducted an aerial radiological survey of the Site, HOVENSA, and residential areas to the north through the Airborne Spectrophotometric Environmental Collection Technology (ASPECT) program. The ASPECT program uses radiation detectors calibrated according to International Atomic Energy Agency (IAEA) specifications and specifically designed for airborne detection and measurement of low-level gamma radiation from naturally occurring and man-made sources. The ASPECT survey results indicated that areas associated with red mud deposition show concentrations of thorium and uranium at approximately 7 picocuries per gram (pCi/g) and 1 pCi/g, respectively, compared to respective background concentrations of approximately 0.09 pCi/g and 0.18 pCi/g (measured in the residential areas to the north). Conversion to exposure units (excluding contributions from cosmic radiation) yielded an exposure rate of 17 microroentgens per hour (µR/hr) from red mud deposition areas, compared to an exposure rate of 2 µR/hr in residential areas to the north [EPA, 2011].

2 Scope/Field Activities

This section describes the screening, sampling, sample management, and analytical procedures implemented during the September 2011 field activities. All activities were completed and all samples were collected as part of the combined ESI-RA with radiological measurements. The logbooks and field data sheets from the field activities are included in Appendix A, and photo documentation is included in Appendix B.

The EPA team completed the sampling and screening effort at the Site from September 12-21, 2011. EPA investigated source areas and migration pathways, including the overland flow of red mud from source areas into water bodies at the Site. Waste samples were collected to characterize sources, and background soil samples were collected as reference for comparison. Surface water and sediment samples were collected to evaluate the impact of waste sources to the on-site and off-site overland flow pathway. Ground water samples were collected from existing on-site monitoring wells to characterize ground water quality in specific areas of the Site and evaluate the impact to ground water. Source areas, sampling locations, and residential areas to the north (Bethlehem Village/Profit Hills and Estate Profit) were screened with radiation detection monitors to evaluate radioactivity and potential exposures.

During the ESI-RA sampling event, WESTON personnel collected totals of 74 waste samples, 7 waste/sediment samples, 17 soil samples, 11 unfiltered ground water samples, 11 filtered ground water samples, 52 surface water samples, and 52 sediment samples (the totals include environmental duplicate samples) from locations on and in the vicinity of the Site. WESTON logged sample locations electronically using Global Positioning System (GPS) equipment and performed post-processing differential correction of the GPS data in accordance with EPA Region 2 GPS Standard Operating Procedures. The processed GPS data for the sample locations has been transferred to the Sample Location Map (Figure 4) using Geographic Information Systems (GIS).

Table 1 presents the latitude and longitude coordinates of sample locations, expressed in decimal degrees. Table 2 presents the sample descriptions and analyses performed for all samples collected during the September 2011 sampling event.

2.1 Radiological Screening

Prior to collecting samples from the waste source areas (RMA, RMB, ADP, and FBS), as well as many of the surface water/sediment sample locations, EPA performed radiological screening of proposed sample locations using a Ludlum Model 19 MicroR meter. Areas of approximately 100 square feet around each proposed location were screened and red mud waste samples were collected from the location within the area with the highest reading. Upon sample collection, EPA measured gamma exposure rates (expressed in µR/hr) at ground surface and at 1 meter height for each location. Additionally, EPA performed dose rate screening of RMA and RMB

using a SAM-940 nuclide detector equipped with a 2-inch by 2-inch sodium iodide (NaI) probe. At each screening location, the SAM-940 acquired measurements over a 3-minute time interval.

EPA also performed gamma count rate surveys measuring gamma activity as counts per minute (cpm) along the northern fence-line north of RMA, and in adjacent off-site locations to the north of RMA including the Bethlehem Village/Profit Hills (Harvey) residential area, Estate Profit (Matthews Charles) residential area, the Pedro Cruz Ballfield, and the Pedro Cruz Recreation Area. These surveys were performed with the Rapid Assessment Tool (RAT), which included a Ludlum Model 2241 meter equipped with a 2-inch by 2-inch NaI probe mounted in a stroller. All radiological screening activity locations were recorded using GPS equipment. Radiological screening results are discussed in the May 2012 EPA report titled *Radiological Assessment Report, St. Croix Alumina (Renaissance Park) Site, St. Croix, U.S. Virgin Islands (RAR)*, dated May 2012.

2.2 pH Measurements

Based on the expected high pH (corrosive) nature of red mud, the sampling team measured the pH of all samples collected during the ESI-RA sampling event for site characterization and to identify samples that might be corrosive enough to require compliance with applicable regulations regarding air transport to the laboratories. WESTON calibrated the pH meters used for these measurements with pH 7 and pH 10 buffer solutions using a two-point calibration at least on a daily basis. Aqueous samples were field-tested for pH according to EPA Method 9040C directly at the sampling location or from an extra aliquot brought back to the command post. Solid samples were field-tested for pH according to EPA Method 9045D, using the following procedures:

- A 20-gram aliquot of sample was weighed and mixed with 20 milliliters of deionized water in an unused 2-ounce (125-mL) glass jar.
- The mixture was shaken for 5 minutes and then allowed to settle for at least one hour.
- The sampling team measured the pH of the mixture, and recorded the pH measurement on a field log sheet.

Tables 3 and 4 present the pH measurements for solid and aqueous matrix samples, respectively. Both data sets are sorted from highest (i.e., most alkaline) to lowest. The pH measurements for all samples are presented in Figure 5.

2.3 Sampling

During the ESI-RA sampling event, WESTON personnel collected a total of 74 waste samples from the four source areas (RMA, RMB, ADP, and FBS), 7 waste/sediment samples from the RMA Depositional Area, 17 background soil samples, 11 unfiltered ground water samples, 11 filtered ground water samples, 52 surface water samples, and 52 sediment samples (the totals

include environmental duplicate samples) from locations on and in the vicinity of the Site. Table 1 lists the sample location coordinates and Figure 4 depicts the sample locations. Table 2 lists the sample descriptions and associated analyses.

2.3.1 Background Soil Sampling

The EPA team collected a total of 17 background soil samples (the total includes environmental duplicate samples) from areas on and near the Site believed to be unaffected by the alumina refinery operations, specifically the northeast portion of the subject property and an area near the WWTP west of the Site. Surface soil samples were obtained by collecting material directly from the 0- to 6-inch depth interval below ground surface (bgs) with a dedicated, disposable plastic scoop. Subsurface soil samples were retrieved from depths ranging from 16 to 42 inches bgs with decontaminated bucket augers. Subsurface soil samples were obtained by boring to refusal with a bucket auger. Once refusal was encountered by the auger, a second hole was bored adjacent to the first hole to a depth approximately one foot shallower than the refusal depth. At that point, a decontaminated bucket auger head was exchanged for the one used to bore to depth, and the subsurface sample was collected with the clean auger at a depth just above refusal. For each sample, the retrieved soil was collected into and homogenized in a dedicated aluminum tray before filling respective sample containers. Remaining soil not used for field pH measurements or laboratory analyses was discarded at the sampling location.

2.3.2 Waste Sampling

The EPA team collected a total of 74 waste samples from the four identified waste sources (RMA, RMB, ADP, and FBS) at the Site, as well as 7 waste/sediment samples from the RMA Depositional Area (the totals include environmental duplicate samples). A total of 51 environmental samples were collected from RMA, including surface waste samples, subsurface waste samples, surface water samples, and sediment samples. A total of 22 environmental samples were collected from RMB, including surface and subsurface waste samples. A total of 13 environmental samples were collected from ADP, including surface waste samples, subsurface waste samples, surface water samples, and sediment samples. A total of four environmental surface waste samples were collected from FBS.

Waste sampling in all areas was conducted preferentially where waste (e.g., red mud or ash) had come to be located through disposal or migration and where it was currently exposed at the surface. Waste samples were collected using dedicated, disposable plastic scoops and aluminum trays. Surface waste samples were collected from the 0- to 3-inch depth interval. Subsurface waste samples were retrieved from the depths noted in Table 2 with decontaminated, stainless-steel bucket augers. Remaining waste material not used for field pH measurements or laboratory analysis was discarded at the sampling location.

Surface waste samples in all areas were obtained by collecting material directly from the surface using a dedicated, disposable plastic scoop. Surface waste material was scooped into dedicated, disposable aluminum trays and homogenized prior to filling respective sample containers.

Due to the dense, fine-grained, and dry composition of the waste material in the top portion of RMA, the proposed sample collection technique of coring or augering straight down from the surface proved prohibitive. The direct-push slam-bar coring device got stuck in the first hole, and the fine, dry material released from auger heads before it could be extracted to the surface. As a field modification, the subsurface waste samples in RMA were collected by augering into the sidewalls of exposed erosion channels at depths greater than 24 inches below the top of the channel. By augering into the side of erosion channels, subsurface waste samples could be collected diagonally or horizontally and required less material to auger through. Subsurface sample depths in this area are measured from the ground surface at the top of the pile directly above the sample. Subsurface waste material was collected into and homogenized in a dedicated, disposable aluminum tray before filling respective sample containers.

Subsurface waste samples in RMB and ADP were obtained by boring to a depth greater than 24 inches bgs with a bucket auger. The depth at which subsurface samples were collected was contingent upon the depth at which the auger encountered refusal. Once refusal was encountered by the auger, a second hole was bored adjacent to the first hole to a depth approximately one foot shallower than the refusal depth. At that point, a decontaminated bucket auger head was exchanged for the one used to bore to depth, and the subsurface sample was collected with the clean bucket auger at a depth just above refusal. Subsurface waste material was collected into and homogenized in a dedicated aluminum tray before filling respective sample containers.

Subsurface waste samples were not collected from the FBS area due to the absence of red mud waste material below 24 inches in the waste pile.

2.3.3 Surface Water/Sediment Sampling

EPA collected a total of 52 surface water samples and 52 sediment samples (the totals include environmental duplicate samples). Two of the surface water samples were collected from RMA. Sample SW-RMA-WST12 was collected from the ponded water at the top of the pile near waste sample location RMA-WST12. Sample RMA-SW57 was collected from the runoff flowing off the pile during a rainstorm on September 20, 2011.

Surface water samples were collected directly into the required containers, without the use of sampling devices, by submerging the bottles. Surface water samples were obtained from perimeter areas where water depths were shallow (i.e., less than 6 inches). The surface water samples from RMA were collected directly into sample containers from surface water sources (i.e., ponded water and runoff). At each specific location where both surface water and sediment samples were collected, surface water samples were collected prior to sediment samples.

Sediment samples were generally collected in correlation to surface water sample locations. Sediment samples were collected with dedicated, disposable plastic scoops from the 0- to 6-inch depth interval and were homogenized in dedicated, disposable aluminum trays prior to filling respective containers. Sediment samples from the RMA Depositional Area were retrieved with a stainless-steel bucket auger prior to homogenization and containerization. All remaining sediment not used for field pH measurements or laboratory analysis was discarded at the sampling location.

2.3.4 Ground Water Sampling

The EPA team collected a total of 11 unfiltered ground water samples and 11 filtered ground water samples (each total includes one environmental duplicate sample). Ground water samples were collected from existing on-site monitoring wells using low-flow sampling procedures. Wells were purged and sampled at a flow rate below 500 milliliters per minute (mL/min) with a bladder pump. Dedicated, disposable bladders and sample tubing were used for each well. During well purging, the following field indicator parameters were measured and recorded at 3- to 5-minute intervals: pH, temperature, dissolved oxygen (DO), and conductivity. Wells were purged until these indicator parameters stabilized for three consecutive readings. In-line analyzers and continuous readout displays were used. The bladder pump was decontaminated prior to sampling and between well sampling locations. Filtered ground water samples were collected through in-line, dedicated, disposable, 0.45-micron filter cartridges.

2.3.5 Blanks

Five rinsate blanks were collected to demonstrate adequate decontamination of non-dedicated sampling equipment. Deionized water was poured over the equipment (hand augers, bladder pumps) and into the sample containers. Four trip blank samples (in conjunction with the ground water samples for volatile organic compounds (VOC) analysis) were collected to demonstrate that atmospheric VOCs were not seeping into sample vials and that there was no cross-contamination between samples.

2.3.6 Decontamination

All non-dedicated sampling equipment involved in soil, waste, and ground water sampling activities (i.e., stainless-steel auger buckets and bladder pumps) was decontaminated prior to and between each sample location. Decontamination was conducted on location and all wastewater was collected into a 5-gallon bucket. The decontaminating procedure consisted of scrubbing the equipment with an Alconox and tap water solution to remove all visual contamination. The equipment was then generously washed with a deionized water pressure spray and allowed to air dry. Rinsate blanks were collected to demonstrate the adequacy of the decontamination procedures.

2.4 Sample Handling and Shipping

Based on a review of available literature on alumina extraction by the Bayer process, as well as existing site-specific information and analytical results, a WESTON dangerous goods (DG) shipping advisor determined that the radioactive and corrosive (high pH) natures of the red mud waste required the field team to ensure that samples offered for shipment by air transport were identified, labeled and packaged in accordance with current International Air Transport Association (IATA) regulations. The WESTON DG shipping advisor determined that the red mud samples from the Site would not be regulated for radiation per IATA regulations and that the radiation component would not have to be considered for shipping purposes. Therefore, pH was the determining factor for safe sample handling and shipping.

As described above in Section 2.3, the sampling team measured the pH of all samples collected during the ESI-RA sampling event. Samples that indicated a pH less than 11.0 were packaged and shipped to the laboratories as environmental samples, while samples with pH of 11.0 or greater were packaged and shipped as dangerous goods (corrosive solids, N.O.S.). Traffic reports (TR)/chain-of-custody (COC) forms, sample labels, custody seals, and other sample documents were completed as specified in the *EPA Contract Laboratory Program (CLP) Guidance for Field Samplers* (May 2010) and *OSWER Directive 9200.1-103, Inclusion of Scribe into the Role of Tracking Superfund Sampling Data* (November 2010).

Each sample container was labeled with sample ID, collection date and time, and required analyses. Aqueous samples for metals and radioactive element analyses were preserved with nitric acid (HNO_3) to pH less than 2. Aqueous samples for VOC analysis were preserved with hydrochloric acid (HCl) to pH less than 2. One custody seal signed by the sampling team was affixed across the closure of each sample container. Each container was sealed in a locking polyethylene bag and placed in a plastic cooler lined with a large plastic bag (i.e., garbage bag). Samples for organic, inorganic, chloride, and TOC analyses were packed with sufficient ice (sealed in polyethylene bags) to cool the samples to 4°C (ice preservation was not required for radiological or grain-size analyses). Non-combustible, adsorbent cushioning material was placed in the cooler to minimize the possibility of container breakage. The large plastic bag was then sealed, the cooler was closed, and custody seals and strapping tape were affixed to the outer packaging.

For shipping and safety purposes, each solid sample that indicated a pH greater than 11.0 was handled as corrosive solids. These samples were classified as follows: UN 3262, Class 8, Corrosive solid, basic, inorganic, n.o.s. (bauxite processing mixture), PG II, Packing instruction Y844, Limited Quantity. The maximum quantity per package (cooler) was 5 kilograms (kg) and the maximum quantity per inner container was 0.5 kg. All coolers were lined with a trash bag, padding, and ice (if required) per normal shipping procedures as described above. WESTON ensured that the outsides of sample containers, plastic bags, and shipping containers were free of red mud or other waste material. Labels on the coolers included a Class 8 sticker, a Limited

Quantity label, a WESTON address label with the laboratory name on it, and a label with the following: UN 3262 / Corrosive solid, basic, inorganic, n.o.s., (bauxite processing mixture) / Net Qty = X Kg, where X is the net weight of samples in the cooler.

With the exception of ground water samples SCA-GW06 and SCA-GW06F collected from monitoring well GM-22, aqueous samples (surface water, ground water, and blanks) were packaged and shipped as environmental samples due to pH levels below 11.0. Due to a pH reading of 12.78 for well GM-22, the unpreserved portions of the sample (TCL SVOCs and Aroclors) were classified as Corrosive liquid, basic, inorganic, n.o.s. (bauxite processing mixture) and were shipped accordingly inside U.N. Specification Packaging. The sample containers were taped shut, sealed within locking polyethylene bags, and packaged with ice and padding inside sealed metal cans. A maximum of four metal cans were packaged inside each appropriate cardboard box. Labels on these outer boxes included a Class 8 sticker, a WESTON address label with the laboratory name on it, and a label with the following: UN 1760 / Corrosive liquid, basic, inorganic, n.o.s., (bauxite processing mixture).

WESTON conducted screening with a Ludlum MicroR meter to confirm that radiation levels did not exceed 250 µR/hr on the outside of any sample container or cooler. Sample coolers and boxes were shipped via common carrier (i.e., Federal Express) to the laboratories. Information relating to the shipment of samples, including the airbill number, sample quantity, and sample types, was reported to the EPA Sample Management Office on the day of or morning after each shipment.

WESTON maintained each sample on ice and under custody until the sample pH was recorded and the determination for shipping procedures completed. The chain-of-custody and sample dispatch information are presented in Tables 5, 6, and 7. Copies of the chain-of-custody records and associated shipping airbills are included in Appendix C.

2.5 Analytical Procedures

The following laboratory analytical procedures were used on this project:

- With a few exceptions, the samples collected in September 2011 were analyzed by the EPA Region 2 Laboratory (EPA-DESA) in Edison, New Jersey for TAL metals according to method EPA 200.7 / SOP C-109 and for mercury according to method EPA 245.1 / SOP C-110.

- All waste samples and selected background soil, surface water, sediment, and ground water samples were analyzed by the EPA National Air and Radiation Environmental Laboratory (EPA-NAREL) in Montgomery, Alabama for radiological characteristics. Solid samples were analyzed for radioisotopes of radium, thorium, and uranium by gamma spectroscopy (including Ra-226, Ra-228, Th-232, and U-238) and alpha spectroscopy (including Th-230, Th-232, U-234, U-235, and U-238). Aqueous samples

were analyzed for radioisotopes (including Ra-226, Ra-228, Th-230, Th-232, U-234, U-235, and U-238) and total uranium by alpha spectroscopy. The isotopic analyses by alpha spectroscopy are generally more accurate than the gamma spectroscopy analyses.

- Surface water and unfiltered ground water samples were analyzed by EPA-DESA for chloride according to Method EPA 300.0 / SOP C-94.

- Sediment samples were analyzed by EPA-DESA for total organic carbon (TOC) according to method EPA 415.1 mod / SOP C-88 and for grain-size distribution according to method ASTM D422-63 / BIO 8.3.

- Approximately 20 percent of the samples were analyzed by Chemtech Consulting Group (CHEMTECH) in Mountainside, New Jersey for Target Compound List (TCL) semivolatile organic compounds (SVOC) and Aroclors through the EPA Contract Laboratory Program (CLP) under Case No. 41746.

- Unfiltered ground water samples and trip blanks were analyzed by CHEMTECH for TCL VOCs under CLP Case No. 41746.

Table 2 shows the applicable laboratory analyses for all samples collected during the ESI-RA sampling event. The samples were received by the laboratories intact and under custody.

3 Physical Characteristics and Observations

This section describes the environmental setting for the Site, including hydrology and geology, and the observations recorded by EPA regarding Site and source conditions and overland drainage pathways. EPA identified and investigated several areas of environmental concern at the Site. Source areas used for disposal or abandonment of waste materials include the RMA, RMB, ADP, and FBS. Surface impoundments and other water bodies along the surface water migration pathway affected or threatened by contaminant migration include the RMS, UCP, LCP, west ditch (WES), coastal mangrove wetland areas, Alucroix Channel (ACC), and the Caribbean Sea. At the time of the EPA investigation in 2011, approximately 2.5 million gallons per day of process water from desalination and storm water flowed through the cooling ponds. The recent cessation of desalination in 2012 has reduced this flow to include only storm water. Photo Logs for the areas of concern at the Site are included in Appendix B. In addition to the areas of concern, impacts to ground water were investigated.

3.1 Source Areas

3.1.1 Red Mud Disposal Area A

RMA covers about 78 acres near the northwest corner of the Site (see Figure 3).. A graded toe road that defines the southern limits of RMA forms the crest of the original containment dike constructed prior to disposal of red mud within the area. RMA received estimated totals of 4,613,449 metric tons of red mud and 110,000 metric tons of ash. The RMA red mud pile exceeds elevations of 100 feet above MSL, and boreholes completed in 2006 indicated red mud thicknesses of 28 to 60 feet throughout RMA.

A release of red mud from RMA to the ocean and shoreline mangrove wetland areas via the west ditch was documented in 2002, and additional releases of red mud to mangrove wetland areas occurred in 2003. The releases occurred after SCA had performed unpermitted grading and recontouring work of the red mud storage area. Measurable quantities of red mud were observed to be deposited within mangrove wetland areas. Although runoff has since been rerouted, the persistent erosion problems from RMA continue. Storm water has created large erosion channels throughout most of RMA, and runoff water carries red mud off the pile in large quantities. The 2006 aerial photograph of the Site and observations made by EPA in June and September 2011 show the migration of red mud across the Site from RMA downslope to the interconnected on-site surface impoundments: the RMS, UCP, and LCP.

3.1.1.1 RMA Depositional Area

EPA observed a large area south of the RMA waste pile covered with up to 2.5 feet of red mud (designated herein as the RMA Depositional Area). During a rainstorm on September 20, 2011, EPA observed red mud-laden runoff flowing off the RMA pile, through the RMA Depositional Area, and into downstream water bodies. This runoff water flowing into and across the RMA Depositional Area exhibited a pH of 10.55. EPA collected eight waste/sediment samples (RMA-

SD57 to RMA-SD63 and RMS-SD47) for TAL metals analysis from seven locations within the RMA Depositional Area. The samples consisted of red mud and showed field pH levels as high as 10.48. Drainage through the RMA Depositional Area leads directly to the RMS and UCP.

3.1.2 Red Mud Disposal Area B

The RMB former disposal area covers approximately 81 acres in the center portion of the Site, south of the former refinery, and it surrounds ADP on three sides (see Figure 3). RMB, which was built on top of a mangrove swamp, consisted of seven disposal cells surrounded by perimeter dikes built of carbonate material. Excess caustic liquid from RMB drained to a dewatering pond in the southeastern part of the source area (i.e., the ADP). RMB received an estimated total of 1,229,149 metric tons of red mud during its years of operation. The April-May 2010 subsurface investigation by IST indicated red mud to depths greater than 24 feet in RMB. Elevated concentrations of arsenic, chromium, mercury, selenium, and vanadium were detected in the RMB waste and in monitoring wells GM-22. Elevated levels of arsenic and vanadium were also detected in monitoring well GM-18. The investigation also showed that the deposited red mud waste and associated shallow ground water maintain high pH levels. The Lagoonal Clay was encountered beneath the waste materials throughout the area. The aqueous samples collected from monitoring well GM-22, believed to represent red mud leachate in RMB above the clay confining layer, showed arsenic at 5,100 µg/L and a pH of 12.81.

The RMB disposal area is partially covered with top soil and a caliche capping layer, and some of it has revegetated, but there are several exposed areas of red mud and associated runoff routes. Drainage pathways from RMB include discharge pipes to the UCP on the north and west sides and discharge to the LCP along the southern edge. The southern drainage pathway is partially fed by a man-made drainage ditch that originates at ADP and flows south through areas of exposed red mud within RMB. Water levels in the available monitoring wells also suggest the possibility of an eastern component to shallow ground water flow from this portion of the Site toward Alucroix Channel.

3.1.3 Ash Disposal Pond

The ADP surface impoundment is located in the approximate center of the subject property and is surrounded on three sides by RMB (Figure 3). ADP was used for the disposal of ash from on-Site boilers. The total area of ADP is approximately 15 acres, the southeast corner of which consists of exposed ash with some vegetated areas; the remainder consists of an unlined disposal pond. The amount of ash deposited in ADP is unknown. During the April-May 2010 subsurface investigation by IST, black ash deposits were encountered as deep as 16 feet bgs. The volume of waste in the accessible portion of ADP (i.e., southeast corner) is conservatively estimated at 5,957 cubic yards (yd^3). A drainage ditch leads south from ADP through RMB and ultimately to the LCP. Water levels in the available monitoring wells also suggest the possibility of an eastern component to shallow ground water flow from this portion of the Site toward Alucroix Channel.

3.1.4 Former Bauxite Storage Shed

FBS is a roofed storage shed with open sides that measures approximately 3.8 acres. FBS was formerly used for the storage of bauxite ore and currently contains a 1-acre pile of red mud, alumina, bauxite, and debris; the pile reaches a maximum height of about 15 feet. Red mud and alumina were transferred to FBS from piping and machinery at the time the facility was shut down. Although FBS is covered by a roof, observations made by EPA in September 2011 indicate that the roof leaks, that rainwater has caused erosion and migration of the stockpiled red mud, that red mud has breached a silt fence along the south side of the pile, and that erosion channels have cut through a containment berm. The primary drainage pathway from FBS flows south-southwest to a storm water basin. In addition to the overland drainage pathways, ground water flows south and east and discharges to Alucroix Channel just east of FBS.

3.2 Surface Water Migration Pathway

The primary overland drainage pathways to surface water at the Site flow south from RMA, through the RMA Depositional Area and Red Mud Settling Pond to the UCP, and subsequently to the LCP. The LCP discharges to Alucroix Channel via permitted outfall and possibly to the coastal mangrove wetland areas via culverts observed during the 2011 investigation. The discharge from the RMS to the northern end of the UCP is via outfall. Drainage from RMB also discharges west to the UCP and south to the LCP, and drainage from ADP flows south through RMB to the LCP. The drainage pathway from FBS is primarily south-southwest to a storm water basin.

3.2.1 Red Mud Settling Pond

The RMS receives red mud runoff from RMA and transports it to the cooling ponds. Observations made by EPA in June and September 2011 and aerial photos show the migration of red mud across the site from RMA downslope to the RMS. As described above, the RMS receives red-mud-laden runoff from the RMA waste pile. In turn, drainage through the RMS discharges via outfall to the UCP. During the September 2011 investigation, EPA observed large quantities of red mud throughout the RMS. Field pH levels in RMS ranged from 9.53 to 10.10 for aqueous samples and 9.68 to 10.48 for solid samples.

3.2.2 Upper Cooling Pond

The 30-acre UCP is a caliche-lined holding basin in the western portion of the property along the west edge of RMB. It was constructed along with the LCP in the 1970s for cooling of process water and retention of storm water. The alumina refinery pumped approximately 50 million gallons per day of seawater from Alucroix Channel, used it as cooling water, and subsequently discharged it to the cooling ponds. At the time of the EPA investigation in 2011, flow through the UCP and into the LCP (via spillway) was approximately 2.5 million gallons per day. The recent cessation of desalination in 2012 has reduced this flow to include only storm water. Red mud is present in significant quantities throughout the UCP.

3.2.3 Lower Cooling Pond

The 150-acre LCP is a caliche-lined holding basin in the low-elevation southern portion of the property along the southern edge of RMB. It was constructed along with the UCP in the 1970s for cooling of process water and retention of storm water. Red mud is present in significant quantities throughout the LCP. The LCP was initially constructed with 20 outfalls to Alucroix Channel and the Caribbean Sea, but silting problems occurred and one primary discharge point (TPDES Outfall 001A) to the ship channel has been used since 1981.

3.2.4 Overland Flow Pathways

Topography at the SCA site generally slopes south toward the Caribbean Sea (Figure 1). There are multiple drainage pathways to surface water from Site sources (Figure 3). Appendix B includes photo documentation depicting many of the overland drainage pathway features at the Site, in downstream order beginning at RMA.

The primary overland drainage pathways at the Site originate from RMA, flow south through the RMA Depositional Area and RMS to the UCP, and subsequently flow to the LCP. The discharge from the RMS to the northern end of the UCP is via outfall. The LCP discharges to Alucroix Channel via permitted outfall and possibly to the coastal mangrove wetland areas via culverts observed during the 2011 investigation. The historical drainage pathway to the West Ditch, which is classified as a perennial surface water body by VIDPNR, is also evaluated. The 2002-2003 red mud releases entered the northern end of the West Ditch, which historically flowed directly south through the coastal mangrove wetland areas to the Caribbean Sea, but was rerouted to the northwest corner of the LCP after the 2002-2003 releases.

The RMB disposal area was partially covered with limestone fill and some of it has revegetated, but there are several exposed areas and associated runoff routes. The aerial photograph and EPA observations document the erosion and migration of red mud from exposed areas within RMB. Drainage pathways from RMB include discharge pipes to the UCP on the north and west sides of RMB and discharge to the LCP along the southern edge. The southern drainage pathway is partially fed by a man-made drainage ditch that originates at ADP and flows south through areas of exposed red mud within RMB.

Although FBS is covered by a roof, observations made by EPA in September 2011 indicate that red mud has breached a silt fence along the south side of the pile and that erosion channels have cut through a containment berm. The primary drainage pathway from FBS flows south-southwest to a storm water basin. Water levels in the available monitoring wells also suggest the possibility of an eastern component to shallow ground water flow from RMB, ADP, and FBS toward Alucroix Channel.

3.2.5 Surface Water Pathway Receptors

The industrial development of the Site and neighboring industrial facilities in the 1960s resulted in the destruction of 260 hectares (642 acres) of mangrove wetland within the Krause Lagoon (i.e., Alucroix Channel). This former wetland complex was once the largest and most important on the south side of St. Croix in terms of high species diversity. Mangroves are legally-protected wildlife habitat in the USVI. A study of waterbird breeding populations conducted by VIDPNR determined that Krause Lagoon is one of the most highly ranked saline wetlands on St. Croix. According to the study, about 50 percent of mangrove and associated saline wetlands have either been degraded or destroyed as a result of coastal development, with the greatest loss occurring in Krause Lagoon. The data gathered by VIDPNR researchers suggested that Krause Lagoon was formerly the best lagoon habitat for waterbirds and several other species. Industrial development of Krause Lagoon resulted in the loss of habitat for up to four species of waterbirds, including the Least Bittern (*Ixobrychus exilis*), which is protected under the Migratory Bird Treaty Act (16 U.S. C. §§ 703-711). The LCP is surrounded by mangroves and remains an important habitat for waterbirds. EPA observed brown pelicans and snowy egrets in the LCP, including pelicans foraging for fish such as tilapia.

From September 9-16, 2011, WESTON personnel including a Certified Wetland Scientist performed reconnaissance to observe wetlands located at and in the vicinity of the Site. The observed wetlands were compared to wetlands mapping included in the U.S. Fish and Wildlife Service National Wetland Inventory (NWI) database. WESTON evaluated the type of vegetated wetlands along the surface drainage pathway for the Site per 40 CFR 230.3, and also evaluated the continuity of vegetated wetland frontage along water bodies including the UCP, LCP, Alucroix Channel, west ditch, and coastal areas. The WESTON wetland scientist observed hydric soils, wetland hydrology, and wetland vegetation (primarily mangroves) at all locations designated as wetlands in the NWI, including the UCP and LCP, the barrier island marsh/swamp complexes south and west of the LCP, and the red mangrove swamps located along both sides of Alucroix Channel. In addition, the west ditch was found to contain wetland areas, although it is not included as a wetland in the NWI. Wetland frontage was documented along the on-site water bodies, including the UCP, LCP, and west ditch (upper and lower sections).

The coastal area at the Site is a fishery. During the 2011 investigation, EPA observed a person fishing for consumption in the ocean near the location of the historical red mud release. Molasses Pier at the end of Alucroix Channel is also regularly used for fishing by the local population. These locations are part of fishing areas that extend along the entire south shore of St. Croix. Leatherback, green, and hawksbill sea turtle habitats are also located along the south shore of St. Croix. The green sea turtle is a federally-designated threatened species; the hawksbill and leatherback sea turtles are federally-designated endangered species.

3.3 Ground Water Pathway

The Site is underlain directly by the Kingshill aquifer, the principal source of ground water in St. Croix. The southern portion of the Site, including the red mud deposits in RMB, is underlain by an average of 12 feet of Lagoonal Clay that might impedes downward migration of contaminants into the aquifer. Previous investigations have shown the presence of fresh water in the aquifer beneath the northern portion of the Site, with a transition zone leading to a sharp increase in salinity just north of the channel and RMB. The 1982 investigation by G&M indicated that baseline water quality at the Site is better than the Fairplain and Barren Spot well fields. A 1990 study indicated that there is a limited amount of usable ground water in the aquifer at the Site (up to about 100,000 gallons per day [gpd]) [TAHAL, 1990]. A follow-up study indicated that ten wells drilled in 1990 could produce up to 432,000 gpd of good-quality fresh water [Bioimpact, 1991]. These wells are not known to have been used except as irrigation for the north slope of RMA in the late 1990s [SSPAI, 2010].

3.3.1 Regional Geology

The island of St. Croix consists of two physiographic areas: (1) rugged hills and low mountains that make up the Northside Range and East End Range, and (2) low-lying to gently rolling hills of the Central Limestone Plain, in which the Site is located. The Northside and East End ranges are horst blocks consisting primarily of the Cretaceous-age Mount Eagle Group, a diverse assemblage of well-lithified, volcanogenic, sedimentary strata, as well as some early-Tertiary igneous intrusive rocks. The Central Limestone Plain is underlain by rocks of the Kingshill Basin, a graben structure filled with a series of poorly-lithified limestone formations of early Miocene to Pliocene age. In ascending order, the rock units of the Kingshill Basin include the Jealousy Formation, Kingshill Limestone (La Reine Member and Mannings Bay Member), and Blessing Formation. Although the deepest drilling of the Kingshill Basin is approximately 1,500 feet below land surface, the total thickness of sediments in the basin might approach 6,000 feet.

The relatively flat-lying rocks of the Kingshill Basin represent a shallowing sequence of marine deposition, from deep-water sediments to shelf and slope facies to reef and lagoon deposits. The early Miocene-age Jealousy Formation consists mainly of planktonic, foraminifera-rich muds, with some basal layers of calcareous conglomerate. A distinctive but unexplained color change marks the boundary between the dark, blue-gray to gray Jealousy Formation and the overlying light buff Kingshill Limestone of Miocene age.

The Kingshill Limestone consists of the basal La Reine Member, a lithologically diverse unit dominated by planktonic foraminiferal carbonate mud and marl, and the upper Mannings Bay Member, which consists of thinly-bedded limestone strata characterized by benthic foraminifera and shelf-derived carbonate clasts. The Blessing Formation of Pliocene age, which unconformably overlies the Mannings Bay Member along St. Croix's southern coast, consists of reef and shelf limestone with patchy zones of dolomitization. The Blessing Formation is thickest (up to 100 feet) at and in the immediate vicinity of the Site, in an area formed by a subsidiary

Pliocene-age graben structure. The Mannings Bay Member and Blessing Formation are coarser-grained than the underlying rocks (they contain poorly-lithified carbonate sand and gravel) and are more affected by diagenetic alteration. Clay-rich alluvium fills some karst cavities in the Blessing Formation and Mannings Bay Member at the Barren Spot well field located northeast of the Site.

Unconsolidated Quaternary-age deposits consisting of alluvial fan, debris flow, beach deposits, and lagoon sediments cover some areas of the central plain, primarily along the northern and southern margins. The alluvial-fan deposits along the Northside Range consist mainly of silt- or clay-rich material less than 30 feet in thickness. In addition, clayey to gravelly alluvium ranging in thickness from 30 to 80 feet fills Pleistocene-age stream valleys incised through the limestone. In some areas, the alluvium contains dark, terrigenous material derived from weathering of the Cretaceous rocks. In areas immediately overlying the Kingshill Limestone, the alluvium consists of light-colored, carbonate material derived from the limestone, and it is difficult to distinguish alluvium from the underlying formations. The Quaternary deposits are thickest (up to 130 feet) along the south coast at and near the Site, where alluvium and lagoon deposits underlie the former Krause Lagoon [USGS, 2002].

3.3.2 Site Geology

The stratigraphic units encountered at the Site during previous subsurface investigations include Lagoonal Clay underlain by the Blessing Formation and Kingshill Limestone (i.e., the upper Kingshill aquifer). The northern portion of the Site, including most of RMA, is an outcrop area of the geologic units that make up the upper Kingshill aquifer, the Mannings Bay Member and Blessing Formation. Exposures of the upper Kingshill aquifer stratigraphic units can be observed in cuts and excavations at the Site and surrounding area. In the area south of RMA, Lagoonal Clay overlies the Blessing Formation in a wedge that thickens south toward the Caribbean Sea. The Lagoonal Clay, which has an average thickness of 12 feet beneath RMB, also contains lenses and layers of sand-rich material.

Table 8 provides the stratigraphic descriptions of the screened interval for numerous on-site monitoring wells. Existing monitoring well logs for the Site are included in Appendix D. Monitoring well and boring logs for the Site show that the wells are completed in a wide variety of carbonate deposits indicative of the poorly-lithified Kingshill aquifer. The descriptions include: limestone ranging from highly weathered to very hard; marl; carbonate sand, gravel, silt, and clay deposits, often with limestone fragments, cobbles, and lenses; caliche; and calcarenite. Color descriptions range from white to orange, and in some cases light grays. There is also a wide range of permeabilities reported, from very low permeability to very permeable. The deposits range from soft to very hard, and voids have been encountered in some boreholes. The Lagoonal Clay is present throughout the southern portion of the Site, but it has not been encountered throughout most of the northern portion of the Site. Weathered limestone of the

Blessing Formation was encountered beneath the Lagoonal Clay in at least one well (G-6) in the southeastern portion of the Site and in direct-push borings in RMB.

3.3.3 Hydrogeology

The principal aquifer on St. Croix is the Kingshill aquifer, which consists of the Kingshill Limestone and Blessing Formation. The Site is located in the outcrop area for the most permeable and porous section of the Kingshill aquifer. The upper Kingshill aquifer consists of the Blessing Formation and Mannings Bay Member, which are more permeable and porous than the underlying units. In formations below the upper aquifer, primary porosity is microscopic with coarser sediments having undergone cementation and recrystallization that destroyed the original permeability. Diagenetic factors such as dissolution of unstable minerals and karstification have affected the permeability of the upper Kingshill aquifer. The Kingshill can be difficult to distinguish from the overlying alluvium that's derived from the aquifer rocks.

Although the Kingshill aquifer is widespread in the Central Plain region, water production is patchy and is poor in large areas. Production in the aquifer is limited to areas where terrigenous components have allowed porosity to be preserved, or production stems from incursion of alluvial aquifers. Fractures within the Kingshill Limestone are also a potential source of water and have been developed in water supply drilling. Most large-yield wells completed in the Kingshill aquifer are also screened in alluvium that overlies or infills incised channels. The alluvial deposits serve as a temporary storage zone for rainfall, runoff, and ground water slowly entering the Kingshill aquifer. The transmissivity of the River Gut alluvial deposits ranges from 20-450 square meters per day (m^2/d). The Fairplain well field is located in this alluvial valley.

Ground water in the Kingshill aquifer beneath the Site is under water-table or semi-confined conditions and generally flows southward to the Alucroix Channel and Caribbean Sea. Water is generally within a few feet of mean sea level (MSL). Ground water in the Lagoonal Clay and fill materials above the Kingshill aquifer is at higher elevation, possibly indicating that there is infiltration to the Kingshill aquifer via a downward flow gradient or discharge to the ship channel and the Caribbean Sea. In 2010, seepage of ground water into the north end of Alucroix Channel and stalagmite-like encrustations at the discharge point were observed. The ship channel is considered to be a major ground water discharge location, with an estimated flow of 25 gallons per minute (gpm) into the northwestern portion of the channel.

In the area south of RMA, Lagoonal Clay overlies the Blessing Formation in a wedge that thickens to the south toward the Caribbean Sea. Previous subsurface investigations indicate that the Lagoonal Clay beneath RMB averages 12 feet in thickness and can be very dense, with hydraulic conductivities from 10^{-9} to 10^{-6} centimeters per second (cm/s). However, layers and lenses of sand and gravel have also been encountered within the Lagoonal Clay. Although the Lagoonal Clay underlies a significant portion of the Site, the majority of RMA is located north of the Lagoonal Clay and sits directly atop the Kingshill aquifer.

In addition to the on-site stratigraphy, the River Gut just west of the Site is an alluvial-filled stream valley. The Fairplain wells are primarily completed within the alluvium to depths of 57 to 105 feet.

Table 9 presents a summary of historical on-site ground water results for contaminants of concern (arsenic, chromium, mercury, selenium, and vanadium) and water quality parameters.

3.3.4 Aquifer Use and Usability

The Site is located in the outcrop area of the most permeable and porous section of St. Croix's principal aquifer. The large number of wells completed in the Kingshill aquifer attests mostly to its areal extent (approximately 30 square miles) and to the limited supply available from other sources rather than its production capabilities. The underlying Jealousy Formation is not a significant water producer and is considered the hydrologic basement, mainly due to declining water quality with increasing depth. The discontinuous alluvial aquifer is not a reliable source of ground water due to limited areal extent. Production of fractured bedrock wells in USVI has met limited success, with very low sustainable yields of less than 1.0 liter per second (L/s). Although the Kingshill aquifer does not have great water quality or production, it is the best of scarce ground water resources on the island.

In 1990, Tahal Consulting Engineers Ltd on behalf of VIALCO completed an assessment of potable ground water at the Site. This evaluation of two test wells (V-1 and V-2), drilled to 100 and 120 feet in the northeastern portion of the Site, indicated that there is a sufficient fresh water supply for approximately 110,000 gallons per day (gpd) at the Site and that the ground water quality in the aquifer at the Site was better than expected [TAHAL, 1990]. Further evaluation of aquifer characteristics, which included installation of ten additional wells (V-3 through V-12) and a pumping test in the northeastern portion of the Site, estimated a production level of 432,000 gpd of good-quality fresh water from the wells. The wells ranged in depth from 130 to 175 feet and were completed in limestone and marl. Well yields for nine of the ten wells ranged from 40 to 50 gallons per minute (gpm). Specific conductance upon drilling ranged from 1,200 to 2,400 micromhos per centimeter (µmhos/cm) and dropped significantly upon development and pumping [Bioimpact, 1991]. These wells are not known to have been used except as irrigation for the north slope of RMA in the late 1990s [SSPAI, 2010].

There are numerous inactive well fields located within the Site vicinity, the closest being the Fairplain well field to the west and the Barren Spot well field to the northeast. The chloride concentrations in the northern portion of the Site (generally 100 mg/L to 1,000 mg/L) are similar to those found in public supply wells that have been used for potable water withdrawal. For instance, Fairplain Well 6 showed chloride concentrations ranging from 258 mg/L to 540 mg/L during periodic monitoring by USGS from 1987 to 2001, and Barren Spot Well 7 showed chloride at 288 to 722 mg/L during the 1960s. USGS has reported that the Kingshill aquifer in St. Croix's south-central coast area is subject to industrial contamination or to saltwater intrusion if pumped heavily, and the island has transitioned largely to seawater desalination in recent

years. Although the public-supply wells are currently inactive, they are available for future use or emergency purposes. In addition, the aquifer is still used as a source of private potable water within 4 miles of the Site. Community supply wells serving the Pepper Tree Terrace and Mutual Homes housing complexes are located between 2 to 3 miles northeast and 3 to 4 miles northwest of the Site sources, respectively.

4 Analytical Results

The analytical results for the September 2011 EPA sampling event are presented in this section. The TCL organics results (VOCs, SVOCs, and Aroclors) did not show elevated concentrations in the on-site sources or pathways and are not included further in the discussion. Tables 10 through 16 present a complete set of the organic analytical results, separated according to sample type.

The inorganics results and radiological results, as well as chloride where applicable, are discussed below according to area of concern. Table 17 presents the minimum and maximum results for pH, arsenic, chromium, mercury, selenium, and vanadium within each area of concern and according to matrix (solid and aqueous). Tables 18 through 28 present pH values and the complete EPA-DESA data set, including inorganics, chloride, TOC, and grain size. Figures 6 through 10 present the arsenic, chromium, mercury, selenium, and vanadium results according to sample location type. Figure 11 presents the chloride results.

Tables 29 through 36 present the radiological screening results from the field investigation, while Figures 12 through 17 present the spatial distribution of the radiological screening results. Tables 37 through 43 present the radiological laboratory results, while Figures 18 and 19 show the spatial distribution of radiological laboratory results for background and on-site areas, respectively. The radiological screening and laboratory analytical results are discussed in further detail in the EPA report titled *Radiological Assessment Report, St. Croix Alumina (Renaissance Park) Site, St. Croix, U.S. Virgin Islands,* dated May 2012, which is included as Appendix E.

The gamma spectroscopy results for Th-232, Ra-226, and U-238 presented in this report were estimated using other radioisotopes with the assumption of secular equilibrium. The gamma spectroscopy results for Ra-228 presented in this report were estimated using the actinium-228 energy peak. Since the isotopic analyses by alpha spectroscopy are generally more accurate than the gamma spectroscopy analyses, only Ra-226 and Ra-228 results were evaluated from the gamma spectroscopy analyses along with the thorium and uranium alpha spectroscopy analyses.

The electronic files for the laboratory analytical results, including electronic data deliverables, are included on the data disc in Appendix F.

4.1 Background Soil

Inorganics:

EPA analyzed eight background soil samples (including one environmental duplicate) for TAL Metals. Surface soil samples BG-S01 through BG-S06 were collected from the 0- to 6-inch depth interval in the northeastern portion of the Site. Soil sample BG-SS02 was collected at the same location as BG-S02 from a depth of 16 inches bgs, which was the maximum auger refusal depth in the northeastern portion of the Site. Subsurface soil sample BG-S16A for TAL Metals analysis

was collected at a depth of 3.5 ft bgs from an area near the WWTP west of the Site. As shown below, the concentrations of Site-related contaminants were low relative to red mud and ash waste samples. Table 18 presents the metals results for background soil samples.

- Aluminum, iron, and sodium concentrations in background soil samples ranged from 3,100 to 30,000 mg/kg; 3,400 to 30,000 mg/kg; and 130 to 890 mg/kg, respectively.
- Arsenic was detected at concentrations ranging from 2.6 to 5.0 mg/kg in the northeastern background soil samples, and at 2.9 mg/kg in sample BG-S16A.
- Chromium was detected at concentrations ranging from 8.2 to 48 mg/kg in the northeastern background soil samples, and at 28 mg/kg in sample BG-S16A.
- Mercury concentrations in the northeastern background soil samples ranged from non-detect (three samples) to 0.128 mg/kg (this value was qualified for potential high bias). Mercury was not detected in sample BG-S16A.
- Vanadium was detected at concentrations ranging from 10 to 64 mg/kg in the northeastern background soil samples, and at 110 mg/kg in the background subsurface soil sample.
- Selenium, antimony, cadmium, and silver were not detected in any of the background soil samples.

Radiological Isotopes:

EPA analyzed 12 background soil samples (including one laboratory duplicate) for radium, thorium, and uranium isotopes. Surface soil samples BG-S01 and BG-S07 through BG-S15 were collected from the 0- to 6-inch depth interval in the northeastern portion of the Site. Sample BG-S16A for radiological analyses was collected from the 0- to 6-inch depth interval from the area near the WWTP west of the Site.

- Ra-226 results ranged from 0.03 to 0.57 pCi/g in the background soil samples, with an average result of 0.28 pCi/g.
- Ra-228 results ranged from 0.03 to 0.74 pCi/g in the background soil samples, with an average result of 0.34 pCi/g.
- Th-230 results ranged from 0.15 to 0.86 pCi/g in the background soil samples, with an average result of 0.46 pCi/g.
- Th-232 results ranged from 0.04 to 0.73 pCi/g in the background soil samples, with an average result of 0.36 pCi/g.

- U-234 results ranged from 0.04 to 0.33 pCi/g in the background soil samples, with an average result of 0.23 pCi/g.
- U-235 results ranged from 0.00 to 0.06 pCi/g in the background soil samples, with an average result of 0.02 pCi/g.
- U-238 results ranged from 0.12 to 0.34 pCi/g in the background soil samples, with an average result of 0.23 pCi/g.

4.2 Waste Materials

The contaminants of concern in the red mud waste deposited in both waste disposal areas (RMA and RMB), as well as the FBS, include arsenic, chromium, mercury, selenium, and vanadium, as well as antimony, cadmium, and silver. The red mud waste also contains elevated concentrations of aluminum, iron, and sodium. Radiological contaminants of potential concern include the isotopes of radium, thorium and uranium including Ra-226, Ra-228, Th-230, Th-232, U-234, U-235, and U-238. The primary radiological contaminant at the Site is associated with the Th-232 decay chain.

The contaminants of concern in the waste ash deposited in ADP are arsenic, mercury, and selenium, as well as antimony and cadmium. The ash contains elevated concentrations of sodium, but does not contain elevated levels of aluminum or iron. The chromium and vanadium concentrations in the ash samples were comparable to background soil concentrations. The radiological contaminants of potential concern in waste ash deposited in the ADP include the isotopes of radium, thorium, and uranium and were found to occur at levels that are one to two orders of magnitude lower than those observed in source areas RMA, RMB, and FBS.

4.2.1 Red Mud Disposal Area A

The EPA sampling team collected surface and subsurface waste samples consisting of red mud from the RMA pile. Field pH readings for the RMA red mud samples indicated pH values ranging from 9.45 to 12.52. The results confirm that the red mud waste material in RMA contains arsenic, chromium, mercury, selenium and vanadium, as well as antimony, cadmium, and silver. The analytical results confirm that radioisotopes are present above background in the red mud samples and that Th-232 and Ra-228 are the most prolific isotopes in the waste material.

Inorganics:

EPA analyzed 21 surface waste samples (including one environmental duplicate) and 20 subsurface waste samples (including one environmental duplicate) from RMA for TAL Metals. The surface waste samples were collected from the 0- to 3-inch depth interval, and the depths of subsurface samples ranged from > 2 ft bgs to 8 ft bgs. All waste samples collected from RMA consisted of red mud. Table 19 presents the pH and metals results for RMA waste samples.

- Aluminum, iron, and sodium concentrations in the red mud samples collected from RMA ranged from 36,000 to 140,000 mg/kg; 170,000 to 380,000 mg/kg; and 4,400 to 95,000 mg/kg, respectively.

- Arsenic was detected in all waste samples collected from RMA, at concentrations ranging from 3.6 to 16 mg/kg in surface samples and 3.3 to 15 mg/kg in subsurface samples.

- Chromium was detected in all waste samples collected from RMA, at concentrations ranging from 280 to 870 mg/kg in surface samples and 250 to 1,500 mg/kg in subsurface samples.

- Mercury was detected in all waste samples collected from RMA, at concentrations ranging from 0.138 to 0.422 mg/kg in surface samples and 0.076 to 0.513 mg/kg in subsurface samples.

- Selenium was detected in nine surface waste samples collected from RMA, at concentrations ranging from 2.6 to 16 mg/kg. Selenium was not detected in subsurface samples from RMA.

- Vanadium was detected in all waste samples collected from RMA, at concentrations ranging from 490 to 1,300 mg/kg in surface samples and 470 to 790 mg/kg in subsurface samples.

- Antimony was detected at concentrations of 3.1 mg/kg in one surface sample and 3.1 to 7.4 mg/kg in four subsurface samples collected from RMA. Cadmium was detected at concentrations ranging from 0.35 to 1.6 mg/kg in seventeen surface samples and 0.9 to 1.7 mg/kg in five subsurface samples collected from RMA. Silver was detected at concentrations ranging from 0.58 to 1.6 mg/kg in seventeen surface samples and 0.9 to 1.3 mg/kg in five subsurface samples collected from RMA.

Radiological Isotopes:

EPA analyzed 23 surface waste samples (including one environmental duplicate) and 20 subsurface waste samples (including one environmental duplicate) from RMA for radium, thorium, and uranium isotopes. The surface waste samples were collected from the 0- to 3-inch depth interval, and the depths of subsurface samples ranged from > 2 ft bgs to 8 ft bgs. All waste samples collected from RMA consisted of red mud.

- Ra-226 and Ra-228 results for the RMA waste samples ranged from 1.6 to 6.7 pCi/g and 10 to 24 pCi/g, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228 with background subtracted) in the samples ranged from approximately 11 to 27 pCi/g.

- Th-230 and Th-232 results for the RMA waste samples ranged from approximately 1 to 6 pCi/g and 5 to 22 pCi/g, respectively. The sum of thorium (i.e., sum of Th-230 and Th-

232 with background subtracted) in the samples ranged from approximately 6 to 25 pCi/g.

- U-234 results for the RMA waste samples ranged from 1.2 to 6.5 pCi/g, U-235 results ranged from non-detect to 0.30 pCi/g, and U-238 results ranged from 1.3 to 5.9 pCi/g.

4.2.1.1 RMA Depositional Area

The EPA sampling team collected surface sediment/waste samples consisting of red mud from RMA Depositional Area. Field pH readings for the RMAD samples ranged from 9.84 to 10.48, with the exception of a pH reading of 7.52 in sample RMA-SD61. The results confirm that the waste material in RMAD contains arsenic, chromium, mercury, selenium and vanadium, as well as antimony, cadmium, and silver. The analytical results confirm that radioisotopes are present above background and that Th-232 and Ra-228 are the most prolific isotopes.

Inorganics:

EPA analyzed seven surface sediment/waste samples (including one environmental duplicate) from RMAD for TAL Metals. The samples collected in this area consisted of red mud from the 0- to 6-inch depth interval. Table 20 presents the metals results for the RMAD samples.

- Aluminum, iron, and sodium concentrations in samples collected from RMAD ranged from 22,000 to 47,000 mg/kg, 130,000 to 380,000 mg/kg, and 1,100 to 21,000 mg/kg, respectively.

- Arsenic was detected at elevated concentrations in all waste samples collected from RMAD, at concentrations ranging from 7.8 to 18 mg/kg.

- Chromium was detected at elevated concentrations in all waste samples collected from RMAD, at concentrations ranging from 180 to 410 mg/kg.

- Mercury was detected at elevated concentrations in all waste samples collected from RMAD, at concentrations ranging from 0.137 to 0.469 mg/kg.

- Selenium was detected at elevated concentrations in six of seven waste samples collected from RMAD, at concentrations ranging from 2.3 to 3.7 mg/kg.

- Vanadium was detected at elevated concentrations in all waste samples collected from RMAD, at concentrations ranging from 400 to 980 mg/kg.

- Antimony was detected in all waste samples collected from RMAD, at concentrations ranging from 3.6 to 10 mg/kg. Cadmium was detected in four of seven waste samples collected from RMAD, at concentrations ranging from 0.34 to 0.61 mg/kg. Silver was detected in all waste samples collected from RMAD, at concentrations ranging from 0.61 to 1.3 mg/kg.

Radiological Isotopes:

EPA analyzed seven surface sediment/waste samples (including one environmental duplicate) from RMAD for radium, thorium, and uranium isotopes. The waste samples collected in this area consisted of red mud from the 0- to 6-inch depth interval.

- Ra-226 and Ra-228 results for the RMAD sediment/waste samples ranged from 0.8 to 3.1 pCi/g and 5 to 11 pCi/g. The sum of radium (i.e., sum of Ra-226 and Ra-228 with background subtracted) in the samples ranged from approximately 5 to 14 pCi/g.

- Th-230 and Th-232 results for the RMAD sediment/waste samples ranged from 0.6 to 1.8 pCi/g and 4 to 10 pCi/g, respectively. The sum of thorium (i.e., sum of Th-230 and Th-232 with background subtracted) in the samples ranged from approximately 4 to 11 pCi/g.

- U-234 results for the RMAD sediment/waste samples ranged from 0.5 to 1.5 pCi/g, U-235 results ranged from non-detect to 0.2 pCi/g, and U-238 results ranged from 0.5 to 1.5 pCi/g.

4.2.2 Red Mud Disposal Area B

During the September 2011 sampling event, EPA collected surface and subsurface waste samples consisting of red mud from RMB. Field pH readings for the RMB waste samples ranged from 8.06 to 12.59. The results confirm that the red mud waste material in RMB contains arsenic, chromium, mercury, selenium and vanadium, as well as antimony, cadmium, and silver. The radiological results indicate that the red mud waste material in RMB contains isotopes of radium (Ra-228), thorium (Th-230, Th-232), and uranium (U-234, U-235, U-238).

Inorganics:

EPA analyzed 13 surface waste samples and 9 subsurface waste samples (including one environmental duplicate) from RMB for TAL Metals. The surface waste samples were collected from the 0- to 3-inch depth interval, and the depths of subsurface samples ranged from 3 ft bgs to 10 ft bgs. All waste samples collected from RMB consisted of red mud. Table 21 presents the metals results for RMB waste samples. Table 21 presents the metals results for RMA waste samples.

- Aluminum, iron, and sodium concentrations in waste samples collected from RMB ranged from 18,000 to 150,000 mg/kg; 67,000 to 490,000 mg/kg; and 630 to 70,000 mg/kg, respectively.

- One sample, RMB-WST24A, indicated non-detect results for arsenic, mercury, and selenium, and low concentrations for chromium (16 mg/kg) and vanadium (37 mg/kg).

- Arsenic was detected in all other waste samples collected from RMB, at concentrations ranging from 6 to 21 mg/kg in surface samples and 7.4 to 17 mg/kg in subsurface samples.

- Chromium was detected in all other waste samples collected from RMB at elevated concentrations ranging from 250 to 1,800 mg/kg in surface samples and 180 to 970 mg/kg in subsurface samples.

- Vanadium was detected in all other waste samples collected from RMB, at elevated concentrations ranging from 490 to 1,300 mg/kg in surface samples and 470 to 790 mg/kg in subsurface samples.

- Mercury was detected at concentrations ranging from 0.045 to 0.348 mg/kg in nine surface samples and 0.055 to 0.075 mg/kg in three subsurface samples collected from RMB.

- Selenium was detected at a concentration of 3.1 mg/kg in one surface waste sample collected from RMB. Selenium was not detected in subsurface samples from RMB.

- Antimony was detected in four surface waste samples collected from RMB, at concentrations of 3.3 to 7.6 mg/kg. Cadmium was detected in four surface waste samples collected from RMB, at concentrations of 0.5 to 3.8 mg/kg. Antimony and cadmium were not detected in subsurface samples from RMB. Silver was detected at concentrations ranging from 0.73 to 3.1 mg/kg in six surface samples and 1.6 mg/kg in one subsurface sample collected from RMB.

Radiological Isotopes:

EPA analyzed 13 surface waste samples and 9 subsurface waste samples (including one environmental duplicate) from RMB for gamma spectroscopy and radiological isotope analyses for radium, thorium and uranium. The surface waste samples were collected from the 0- to 3-inch depth interval, and the depths of subsurface samples ranged from 3 ft bgs to 10 ft bgs. All waste samples collected from RMB consisted of red mud.

- Ra-226 and Ra-228 results for the RMB waste samples ranged from 0.9 to 9 pCi/g and 7 to 25 pCi/g, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228 with background subtracted) in the samples ranged from approximately 8 to 29 pCi/g.

- Th-230 and Th-232 results for the RMB waste samples ranged from 1.1 to 9 pCi/g and 6 to 21 pCi/g, respectively. The sum of thorium (i.e., sum of Th-230 and Th-232 with background subtracted) in the samples ranged from approximately 7 to 25 pCi/g.

- U-234 results for the RMB waste samples ranged from 1.1 to 6.3 pCi/g, U-235 results ranged from non-detect to 0.5 pCi/g, and U-238 results ranged from 0.8 to 7 pCi/g.

4.2.3 Ash Disposal Pond

The EPA team collected surface and subsurface waste samples consisting of ash from ADP. Field pH readings for the ADP waste samples ranged from 6.83 to 10.17. The results confirm that the ash waste material in ADP contains arsenic, mercury, and selenium, as well as antimony and cadmium. EPA also collected solid (sediment) and aqueous (surface water) samples for TAL metals and mercury analysis at the water's edge in ADP. The results confirm the presence of arsenic and mercury in solid samples and arsenic in the aqueous samples.

Inorganics:

EPA analyzed two surface waste samples and two subsurface waste samples (including one environmental duplicate) from ADP for TAL Metals. The surface waste samples were collected from the 0- to 3-inch depth interval, and the depth of the duplicate subsurface samples was 4 ft bgs. All waste samples collected from ADP consisted of ash. Table 22 presents the metals results for ADP waste samples.

- Aluminum, iron, and sodium concentrations in waste samples collected from ADP ranged from 3,900 to 16,000 mg/kg; 5,900 to 27,000 mg/kg; and 7,000 to 27,000 mg/kg, respectively.

- Arsenic was detected in all waste samples collected from ADP, at concentrations of 30 and 35 mg/kg in the surface samples and 5.6 and 13 mg/kg in the duplicate subsurface samples.

- Mercury was detected in the surface waste samples collected from ADP, at concentrations of 0.094 and 0.218 mg/kg, but was not detected in the duplicate subsurface samples.

- Selenium was detected in all waste samples collected from ADP, at concentrations of 8.9 and 10 mg/kg in the surface samples and 10 and 11 mg/kg in the duplicate subsurface samples.

- Chromium and vanadium were detected in the waste samples collected from ADP, but at relatively low concentrations ranging from 7.3 to 23 mg/kg and 22 to 99 mg/kg, respectively. These concentrations are comparable to the background soil concentrations presented in Section 4.2.

- Antimony (4.0 and 4.5 mg/kg) and cadmium (0.41 and 0.57 mg/kg) were detected in the surface waste samples collected from ADP, but were not detected in the subsurface samples. Silver was not detected in the waste samples collected from ADP.

Radiological Isotopes:

EPA analyzed two surface waste samples, three subsurface waste samples (including one environmental duplicate), and one sediment sample from ADP for gamma spectroscopy and radiological isotope analyses for radium, thorium and uranium. The surface waste samples were collected from the 0- to 3-inch depth interval, and the depth of the duplicate subsurface samples was 4 ft bgs. All waste samples collected from ADP consisted of ash.

- Ra-226 and Ra-228 results for the ADP waste and sediment samples ranged from 0.6 to 1.6 pCi/g and 0.7 to 1.3 pCi/g, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228 with background subtracted) in the samples ranged from approximately 0.6 to 1.6 pCi/g.

- Th-230 and Th-232 results for the ADP waste and sediment samples ranged from 0.6 to 1.9 pCi/g and approximately 1 to 1 pCi/g, respectively. The sum of thorium (i.e., sum of Th-230 and Th-232 with background subtracted) in the samples ranged from approximately 1 to 2.5 pCi/g.

- U-234 results for the ADP waste and sediment samples ranged from 0.6 to 1.5 pCi/g, U-235 results ranged from non-detect to 0.1 pCi/g, and U-238 results ranged from 0.6 to 1.4 pCi/g.

4.2.4 Former Bauxite Storage Shed

EPA collected surface waste samples consisting of red mud from FBS and from an overland migration pathway behind the shed. Field pH readings for the FBS waste samples ranged from 9.02 to 10.93. The inorganic results show that the red mud waste material at the surface of the FBS pile and running off the pile contains arsenic, chromium, mercury, selenium, and vanadium, as well as antimony, cadmium, and silver. The radiological results of surface waste samples collected from the FBS pile indicate that isotopes of radium (Ra-228), thorium (Th-230, Th-232), and uranium (U-234, U-235, U-238) are present in the waste material.

Inorganics:

EPA analyzed four surface waste samples from FBS for TAL Metals. Three samples were collected from the 0- to 3-inch depth interval of the waste pile in the shed, and one sample was collected from the 0- to 3-inch depth interval of the drainage pathway south of the shed. All waste samples collected from FBS consisted of red mud. Table 23 presents the metals results for FBS waste samples.

- Aluminum, iron, and sodium concentrations in the red mud samples collected from FBS ranged from 68,000 to 100,000 mg/kg; 62,000 to 220,000 mg/kg; and 5,100 to 110,000 mg/kg, respectively.

- Arsenic was detected in the FBS waste pile samples at concentrations ranging from 12 to 47 mg/kg and in the drainage pathway sample at 6.3 mg/kg.

- Chromium was detected in the FBS waste pile samples at concentrations ranging from 140 to 240 mg/kg and in the drainage pathway sample at 99 mg/kg.

- Mercury was detected in the FBS waste pile samples at concentrations ranging from 0.136 to 0.236 mg/kg and in the drainage pathway sample at 0.098 mg/kg.

- Selenium was detected in the FBS waste pile samples at concentrations ranging from 2.4 to 3.2 mg/kg, but was not detected in the drainage pathway sample.

- Vanadium was detected in the FBS waste pile samples at concentrations ranging from 460 to 660 mg/kg and in the drainage pathway sample at 180 mg/kg.

- Antimony was detected in two FBS waste pile samples at concentrations of 4.1 and 6.0 mg/kg. Cadmium was detected in the FBS waste pile samples at concentrations ranging from 0.56 to 0.87 mg/kg and in the drainage pathway sample at 0.72 mg/kg. Silver was detected in the FBS waste pile samples at concentrations ranging from 0.81 to 1.2 mg/kg. Antimony and silver were not detected in the drainage pathway sample.

Radiological Isotopes:

EPA collected four surface waste samples from FBS for gamma spectroscopy and radiological isotope analyses for radium, thorium and uranium. Three samples were collected from the 0- to 3-inch depth interval of the waste pile in the shed, and one sample was collected from the 0- to 3-inch depth interval of the drainage pathway south of the shed. All waste samples collected from FBS consisted of red mud.

- Ra-226 and Ra-228 results for the FBS waste samples ranged from 1.0 to 2.1 pCi/g and 5 to 10 pCi/g, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228 with background subtracted) in the FBS waste pile samples ranged from approximately 7 to 12 pCi/g, and the sum of radium in the drainage pathway sample was 5.1 pCi/g.

- Th-230 and Th-232 results for the FBS waste samples ranged from 0.9 to 2.3 pCi/g and 4 to 10 pCi/g, respectively. The sum of thorium (i.e., sum of Th-230 and Th-232 with background subtracted) in the FBS waste pile samples and drainage pathway sample ranged from approximately 5 to 12 pCi/g.

- U-234 results for the FBS waste samples ranged from 0.9 to 2.6 pCi/g, U-235 results ranged from non-detect to 0.1 pCi/g, and U-238 results ranged from 0.7 to 2.4 pCi/g.

4.3 Surface Water/Sediment

EPA collected a total of 52 surface water samples and 52 sediment samples (the totals include environmental duplicate samples). Two of the surface water samples were collected from RMA. Sample SW-RMA-WST12 was collected from the ponded water at the top of the pile near waste sample location RMA-WST12. Sample RMA-SW57 was collected from the runoff flowing off the pile during a rainstorm on September 20, 2011. Table 24 presents the metals and chloride results for surface water samples, including a comparison to Ambient Water Quality Criteria (AWQC), as expressed by the national recommended Criterion Continuous Concentration (CCC) for protection of aquatic life in saltwater promulgated under Section 304(a)(1) of the Clean Water Act. Table 25 presents the metals results for sediment samples.

4.3.1 Background Surface Water/Sediment Sample Locations

Inorganics:

EPA analyzed four surface water samples designated as background for TAL Metals. Another sample collected from the intake channel on the east side of Alucroix Channel is also considered to represent background conditions. Surface water sample location BG-SW53, which showed elevated concentrations of arsenic, chromium, and vanadium compared to other background locations, was collected along the coast west of the site and near the municipal landfill. Therefore, it is unknown if the elevated concentrations at this location are Site-related.

- Aluminum, iron, and sodium concentrations in the background surface water samples ranged from 460 to 28,000 µg/L; 640 to 51,000 µg/L; and 98,000 to 8,400,000 µg/L, respectively.
- Arsenic was detected at a concentration of 85 µg/L in surface water sample BG-SW53, but was not detected in the other background surface water samples.
- Chromium was detected at concentrations of 7.7 and 75 µg/L in surface water samples BG-SW55 and BG-SW53, respectively, but was not detected in the other background surface water samples.
- Vanadium was detected in three of four background surface water samples, at concentrations ranging from 22 to 270 µg/L.
- Mercury, selenium, antimony, cadmium, and silver were not detected in the background surface water samples.

EPA analyzed five background sediment samples for TAL Metals, including sample ACC-SD52.

- Aluminum, iron, and sodium concentrations in the background sediment samples ranged from 3,500 to 17,000 mg/kg; 4,500 to 24,000 mg/kg; and 1,400 to 4,300 mg/kg, respectively.

- Arsenic was detected in the background sediment samples at concentrations ranging from 1.2 to 5.5 mg/kg.
- Chromium was detected in the background sediment samples at concentrations ranging from 9.6 to 27 mg/kg.
- Vanadium was detected in the background sediment samples at concentrations ranging from 18 to 110 mg/kg.
- Mercury, selenium antimony, cadmium, and silver were not detected in the background sediment samples.

Radiological Isotopes:

EPA did not analyze the background surface water or sediment samples for gamma spectroscopy or radiological isotope analyses, nor did EPA perform radiological screening in this area.

4.3.2 Red Mud Disposal Area A

Inorganics:

EPA analyzed one surface water runoff sample (RMA-SW57) from RMA for TAL Metals. The sample was visibly laden with red mud and its pH was measured at 10.55.

- Aluminum, iron, and sodium concentrations in the surface water runoff sample were 280,000 µg/L; 500,000 µg/L; and 1,200,000 µg/L, respectively.
- Arsenic was detected at a concentration of 150 µg/L in the surface water runoff sample.
- Chromium was detected at a concentration of 2,900 µg/L in the runoff sample.
- Selenium was detected at a concentration of 54 µg/L in the runoff sample.
- Vanadium was detected at a concentration of 5,200 µg/L in the runoff sample.
- Mercury was detected at a concentration of 0.710 µg/L in the runoff sample.
- Antimony, cadmium, and silver were not detected in the surface water runoff sample.

Radiological Isotopes:

EPA analyzed surface water runoff sample RMA-SW57 and ponded water sample SW-RMA-WST12 from RMA for gamma spectroscopy and radiological isotope analyses for radium, thorium, and uranium. The pH of sample RMA-SW57 was measured at 10.55 and the pH of sample SW-RMA-WST12 was measured at 10.43.

- Ra-226 and Ra-228 results for runoff sample RMA-SW57 were 6 and 21 pCi/L, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228) in the sample was approximately 27 pCi/L.

- Ra-226 and Ra-228 results for ponded water sample SW-RMA-WST12 were 0.5 and 5 pCi/L, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228) in the sample was approximately 6 pCi/L.

- Th-230 and Th-232 results for runoff sample RMA-SW57 were 0.54 and 3.4 pCi/L, respectively.

- Th-230 and Th-232 results for ponded water sample SW-RMA-WST12 were non-detect and 0.31 pCi/L, respectively.

- U-234, U-235, and U-238 results for runoff sample RMA-SW57 were 5.1 pCi/L, non-detect, and 3.5 pCi/L, respectively.

- U-234, U-235, and U-238 results for ponded water sample SW-RMA-WST12 were 5 pCi/L, non-detect, and 2.5 pCi/L, respectively.

4.3.3 Red Mud Settling Pond

Inorganics:

EPA analyzed four surface water samples (including one environmental duplicate) from RMS for TAL Metals. Red mud was visually observed at all sample locations. Water was not present at location RMS-SW47 during sample collection.

- Aluminum, iron, and sodium concentrations in surface water samples collected from RMS ranged from 10,000 to 94,000 µg/L; 1,200 to 52,000 µg/L; and 460,000 to 2,800,000 µg/L, respectively.

- Arsenic was detected at concentrations ranging from 29 to 160 µg/L in the surface water samples collected from RMS.

- Chromium was detected at concentrations ranging from 430 to 16,000 µg/L in the surface water samples collected from RMS.

- Selenium was detected at concentrations ranging from 55 to 650 µg/L in three surface water samples collected from RMS; sample RMS-SW46 was non-detect.

- Vanadium was detected at concentrations ranging from 1,300 to 4,500 µg/L in the surface water samples collected from RMS.

- Mercury, antimony, cadmium, and silver were not detected in the surface water samples collected from RMS.

EPA analyzed five sediment samples (including one environmental duplicate) from RMS for TAL Metals. Red mud was visually observed in all RMS sediment samples.

- Aluminum, iron, and sodium concentrations in the RMS sediment samples ranged from 38,000 to 74,000 mg/kg; 120,000 to 340,000 mg/kg; and 16,000 to 33,000 mg/kg, respectively.

- Arsenic was detected in the RMS sediment samples at concentrations ranging from 7 to 15 mg/kg.

- Chromium was detected in the RMS sediment samples at concentrations ranging from 360 to 480 mg/kg.

- Mercury was detected in the RMS sediment samples at concentrations ranging from 0.14 to 0.338 mg/kg.

- Selenium was detected at a concentration of 2.7 mg/kg in sediment sample RMS-SD47, but was not detected in the other RMS sediment samples.

- Vanadium was detected in the RMS sediment samples at concentrations ranging from 370 to 1,100 mg/kg.

- Cadmium was detected in the RMS sediment samples at concentrations ranging from 0.68 to 4.4 mg/kg. Antimony and silver were not detected in the RMS sediment samples.

Radiological Isotopes:

EPA analyzed one surface water sample (RMS-SW45) and one sediment sample (RMS-SD45) from RMS for gamma spectroscopy and radiological isotope analyses for radium, thorium, and uranium.

- Ra-226 and Ra-228 results for surface water sample RMS-SW45 were 1.4 and 16 pCi/L, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228) in the sample was approximately 18 pCi/L.

- Ra-226 and Ra-228 results for sediment sample RMS-SD45 were 3.3 and 12 pCi/g, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228 with background subtracted) in the sample was approximately 15 pCi/g.

- Th-230 and Th-232 results for surface water sample RMS-SW45 were 0.54 and 1.66 pCi/L, respectively.

- Th-230 and Th-232 results for sediment sample RMS-SD45 were 2.0 and 10 pCi/g, respectively. The sum of thorium (i.e., sum of Th-230 and Th-232 with background subtracted) in the sample was approximately 11 pCi/g.
- U-234, U-235, and U-238 results for surface water sample RMS-SW45 were 9 pCi/L, 0.5 pCi/L, and 5 pCi/L, respectively.
- U-234, U-235, and U-238 results for sediment sample RMS-SD45 were 2.0 pCi/g, non-detect, and 1.8 pCi/g, respectively.

4.3.4 Upper Cooling Pond

Inorganics:

EPA analyzed eight surface water samples from UCP for TAL Metals. Red mud was visually observed at all sample locations.

- Aluminum, iron, and sodium concentrations in surface water samples collected from UCP ranged from 230 to 74,000 µg/L; 110 to 29,000 µg/L; and 9,100,000 to 13,000,000 µg/L, respectively.
- Arsenic was detected in seven of eight surface water samples collected from UCP, at concentrations ranging from 9.8 to 27 µg/L.
- Chromium was detected at concentrations ranging from 150 to 780 µg/L in the surface water samples collected from UCP.
- Selenium was detected at a concentration of 37 µg/L in surface water sample UCP-SW37, but was not detected in the other UCP surface water samples.
- Vanadium was detected at concentrations ranging from 45 to 1,500 µg/L in the surface water samples collected from UCP.
- Mercury, antimony, cadmium, and silver were not detected in the surface water samples collected from UCP.

EPA analyzed eight sediment samples from UCP for TAL Metals. Red mud was visually observed in all UCP sediment samples.

- Aluminum, iron, and sodium concentrations in the UCP sediment samples ranged from 49,000 to 86,000 mg/kg; 44,000 to 180,000 mg/kg; and 13,000 to 60,000 mg/kg, respectively.
- Arsenic was detected in the UCP sediment samples at concentrations ranging from 8.1 to 26 mg/kg.

- Chromium was detected in the UCP sediment samples at concentrations ranging from 220 to 550 mg/kg.
- Mercury was detected in the UCP sediment samples at concentrations ranging from 0.076 to 0.314 mg/kg.
- Vanadium was detected in the UCP sediment samples at concentrations ranging from 330 to 640 mg/kg.
- Cadmium was detected in three of eight UCP sediment samples, at concentrations ranging from 0.97 to 1.3 mg/kg. Silver was detected at a concentration of 1.1 mg/kg in sample UCP-SD38, but was not detected in the other UCP sediment samples.
- Selenium and antimony were not detected in the UCP sediment samples.

Radiological Isotopes:

EPA analyzed two surface water samples and three sediment samples from UCP for gamma spectroscopy and radiological isotope analyses for radium, thorium, and uranium.

- Ra-226 and Ra-228 results for UCP surface water samples ranged from 0.2 to 0.7 pCi/L and 1.0 to 10 pCi/L, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228) in the samples ranged from approximately 1.2 to 11 pCi/g.
- Ra-226 and Ra-228 results for UCP sediment samples ranged from 0.5 to 3.2 pCi/g and 2.4 to 13 pCi/g, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228 with background subtracted) in the samples ranged from approximately 2 to 15 pCi/g.
- Th-230 and Th-232 results for UCP surface water samples ranged from non-detect to 0.4 pCi/L and non-detect to 1.8 pCi/L, respectively.
- Th-230 and Th-232 results for UCP sediment samples ranged from 0.9 to 2.7 pCi/g and 3 to 10 pCi/g, respectively. The sum of thorium (i.e., sum of Th-230 and Th-232 with background subtracted) in the samples ranged from approximately 3 to 12 pCi/g.
- U-234 results for UCP surface water samples ranged from 1.2 to 1.9 pCi/L, U-235 results ranged from non-detect to 0.3 pCi/L, and U-238 results ranged from 1.0 to 1.4 pCi/L.
- U-234 results for UCP sediment samples ranged from 2.8 to 3.3 pCi/g, U-235 results ranged from approximately 0.2 to 0.2 pCi/g, and U-238 results ranged from 2.5 to 2.8 pCi/g.

4.3.5 Lower Cooling Pond

Inorganics:

EPA analyzed eight surface water samples from LCP for TAL Metals. Red mud was visually observed at sample locations LCP-SW31, LCP-SW32, and LCP-SW33.

- Aluminum, iron, and sodium concentrations in surface water samples collected from LCP ranged from non-detect to 15,000 µg/L; non-detect to 8,700 µg/L; and 3,800,000 to 9,300,000 µg/L, respectively.
- Arsenic was detected at concentrations ranging from 19 to 220 µg/L in the surface water samples collected from LCP.
- Chromium was detected in five of eight surface water samples collected from LCP, at concentrations ranging from 17 to 240 µg/L.
- Selenium was detected at a concentration of 25 µg/L in surface water sample LCP-SW30, but was not detected in the other LCP surface water samples.
- Vanadium was detected at concentrations ranging from 130 to 2,200 µg/L in the surface water samples collected from LCP.
- Mercury, antimony, cadmium, and silver were not detected in the surface water samples collected from LCP.

EPA analyzed eight sediment samples from LCP for TAL Metals. Red mud was visually observed in samples LCP-SD31, LCP-SD32, and LCP-SD33.

- Aluminum, iron, and sodium concentrations in the LCP sediment samples ranged from 9,800 to 95,000 (J) mg/kg; 5,200 to 41,000 (J) mg/kg; and 5,100 to 56,000 (J) mg/kg, respectively.
- Arsenic was detected in the LCP sediment samples at concentrations ranging from 5.2 to 34 (J) mg/kg.
- Chromium was detected in the LCP sediment samples at concentrations ranging from 35 to 570 (J) mg/kg.
- Selenium was detected in two of eight sediment samples collected from LCP, at concentrations of 1.7 mg/kg (LCP-SD28) and 2.9 mg/kg (LCP-SD30).
- Vanadium was detected in the LCP sediment samples at concentrations ranging from 110 to 590 (J) mg/kg.

- Mercury, antimony, cadmium, and silver were not detected in the LCP sediment samples.

Radiological Isotopes:

EPA analyzed one sediment sample (LCP-SD33) from the LCP for gamma spectroscopy and radiological isotope analyses for radium, thorium and uranium. The sample was collected from the 0- to 3-inch depth interval. Red mud was present in the sample. Surface water samples were not collected from the LCP for gamma spectroscopy or radiological isotope analyses.

- Ra-226 and Ra-228 results for sediment sample LCP-SD33 were 0.1 and 0.3 pCi/g, respectively. The sum of radium (i.e., sum of Ra-226 and Ra-228 with background subtracted) in the sample was approximately 0 pCi/g.
- Th-230 and Th-232 results for sediment sample LCP-SD33 were 0.3 and 0.4 pCi/g, respectively. The sum of thorium (i.e., sum of Th-230 and Th-232 with background subtracted) in the sample was approximately 0.4 pCi/g.
- U-234, U-235, and U-238 results for sediment sample LCP-SD33 were 3.7 pCi/g, 0.2 pCi/g, and 3.4 pCi/g, respectively.

4.3.6 West Ditch

Inorganics:

EPA analyzed three surface water samples (including one environmental duplicate) from WES for TAL Metals. Red mud was visually observed at sample location WES-SW22/WES-SW23. Water was not present at location WES-SW25, where red mud was also visually observed.

- Aluminum, iron, and sodium concentrations in surface water samples collected from WES ranged from 310 to 1,200 µg/L; 470 to 1,800 µg/L; and 5,800,000 to 6,900,000 µg/L, respectively.
- Arsenic, chromium, mercury, selenium, vanadium, antimony, cadmium, and silver were not detected in the surface water samples collected from WES.

EPA analyzed four sediment samples (including one environmental duplicate) from WES for TAL Metals. Red mud was visually observed in samples WES-SD22/WES-SD23 and WES-SD25.

- Aluminum, iron, and sodium concentrations in the WES sediment samples ranged from 24,000 to 41,000 mg/kg; 26,000 to 55,000 mg/kg; and 1,100 to 26,000 mg/kg, respectively.

- Arsenic was detected in the WES sediment samples at concentrations ranging from 4.0 to 8.1 mg/kg.
- Chromium was detected in the WES sediment samples at concentrations ranging from 33 to 160 mg/kg.
- Mercury was detected at a concentration of 0.049 mg/kg in sediment sample WES-SD23, but was not detected in duplicate sample WES-SD22 or the other WES sediment samples.
- Vanadium was detected in the WES sediment samples at concentrations ranging from 110 to 210 mg/kg.
- Silver was detected at a concentration of 0.73 mg/kg in sediment sample WES-SD25.
- Selenium, antimony, and cadmium were not detected in the WES sediment samples.

Radiological Isotopes:

EPA did not analyze any surface water or sediment samples from the West Ditch for gamma spectroscopy or radiological isotope analyses. Radiological screening results in the West Ditch were similar to screening results recorded in background areas.

4.3.7 Coastal Mangrove Areas

Inorganics:

EPA analyzed thirteen surface water samples from MAN for TAL Metals. Red mud was visually observed at sample locations MAN-SW17 and MAN-SW20.

- Aluminum, iron, and sodium concentrations in surface water samples collected from MAN ranged from 120 to 24,000 µg/L; non-detect to 28,000 µg/L; and 540,000 to 11,000,000 µg/L, respectively.
- Arsenic was detected in eleven of thirteen MAN surface water samples, at concentrations ranging from 8.0 (J) to 41 µg/L.
- Chromium was detected in five of thirteen MAN surface water samples, at concentrations ranging from 5.6 to 71 µg/L.
- Vanadium was detected in eight of thirteen MAN surface water samples, at concentrations ranging from 20 to 110 µg/L.
- Mercury, selenium antimony, cadmium, and silver were not detected in the surface water samples collected from MAN.

EPA analyzed thirteen sediment samples from MAN for TAL Metals. Red mud was visually observed in samples MAN-SD17 and MAN-SD20.

- Aluminum, iron, and sodium concentrations in the MAN sediment samples ranged from 790 to 34,000 (J) mg/kg; 1,000 to 50,000 mg/kg; and 5,400 to 48,000 (J) mg/kg, respectively.

- Arsenic was detected in the MAN sediment samples at concentrations ranging from 2.8 (J) to 18 mg/kg. Sample MAN-SD19 showed the highest arsenic concentration.

- Chromium was detected in the MAN sediment samples at concentrations ranging from 3.9 to 140 (J) mg/kg. Sample MAN-SD20 near the former west ditch showed the highest chromium concentration.

- Cadmium was detected at a concentration of 0.7 mg/kg in sediment sample MAN-SD19, but was not detected in the other MAN sediment samples.

- Vanadium was detected in the MAN sediment samples at concentrations ranging from 10 to 210 (J) mg/kg. Sample MAN-SD20 near the former west ditch showed the highest vanadium concentration.

- Mercury, selenium, antimony, and silver were not detected in the MAN sediment samples.

Radiological Isotopes:

EPA did not analyze any surface water or sediment samples from the Coastal Mangrove Area for gamma spectroscopy or radiological isotope analyses. Radiological screening results in the West Ditch were similar to screening results recorded in background areas.

4.3.8 Alucroix Channel

Inorganics:

EPA analyzed five surface water samples from the western edge of ACC for TAL Metals. Red mud was not visibly apparent at the ACC sample locations.

- Aluminum was not detected in the surface water samples collected from ACC. Iron and sodium concentrations in ACC surface water samples ranged from non-detect to 140 µg/L and 8,700,000 to 10,000,000 µg/L, respectively.

- Arsenic was detected at concentrations of 8.5 and 11 µg/L in surface water samples ACC-SW01 and ACC-SW07, respectively. Arsenic was not detected in samples ACC-SW04, ACC-SW05, and ACC-SW06.

- Chromium, mercury, selenium, vanadium, antimony, cadmium, and silver were not detected in the surface water samples collected from ACC.

EPA analyzed five sediment samples from the western edge of ACC for TAL Metals. Red mud was not visibly apparent in the ACC sediment samples. The furthest downstream sample at the mouth of the channel (ACC-SD01) showed lower concentrations than the samples collected closer to Site sources.

- Aluminum, iron, and sodium concentrations in the ACC sediment samples ranged from 1,100 to 25,000 mg/kg; 1,100 to 69,000 mg/kg; and 4,100 to 35,000 mg/kg, respectively.
- Arsenic was detected in the ACC sediment samples at concentrations ranging from 2.2 to 12 mg/kg.
- Chromium was detected in the ACC sediment samples at concentrations ranging from 7.0 to 51 mg/kg.
- Mercury was detected at a concentration of 0.062 mg/kg in sediment sample ACC-SD07, but was not detected in the other ACC sediment samples.
- Selenium was detected at a concentration of 3.4 mg/kg in sediment sample ACC-SD05, but was not detected in the other ACC sediment samples.
- Vanadium was detected in the ACC sediment samples at concentrations ranging from 8.2 to 130 mg/kg.
- Antimony (2.4 mg/kg), cadmium (0.48 mg/kg), and silver (1.8 mg/kg) were detected in sediment sample ACC-SD06, but were not detected in the other ACC sediment samples.

Radiological Isotopes:

EPA did not analyze any surface water or sediment samples from Alucroix Channel for gamma spectroscopy or radiological isotope analyses, nor did EPA perform radiological screening in this area.

4.4 Ground Water

The EPA team collected a total of 11 unfiltered ground water samples and 11 filtered ground water samples (each total includes one environmental duplicate sample) from ten existing on-site monitoring wells.

Inorganics:

EPA analyzed unfiltered and filtered ground water samples (including one environmental duplicate for each) from ten on-site monitoring wells for TAL Metals.

- The reported concentrations of calcium, magnesium, manganese, potassium, and chloride confirm the location of the freshwater/saltwater interface in the Kingshill aquifer approximately at the north end of Alucroix Channel and RMB. The wells are categorized as saltwater (GM-19), freshwater/saltwater mixture (G-11, GM-14), or freshwater (G-9, GM-13D, GM-18, GM-22, VW16, VW25, and VW37). The freshwater chemistry in wells GM-18 and GM-22, both of which are screened at least partially in fill above the Lagoonal Clay, is believed to result from a perched water or mounding situation. High sodium concentrations in well GM-22 are indicative of process seawater leaching from the RMB waste material rather than saltwater interface impacts.

- Samples from monitoring well GM-22, which is screened in the Lagoonal Clay and overlying red mud/sand fill material, represent the caustic leachate within and emanating from the red mud. Samples from this well repeatedly show highly elevated pH levels above 12.3 (the most recent reading by EPA was 12.78). Historically, the well has shown elevated concentrations of arsenic, chromium, mercury, selenium, vanadium, aluminum, and fluorides in both unfiltered and filtered samples, with a maximum arsenic concentration of 5,100 µg/L. The samples collected by EPA from well GM-22 had a noticeable yellowish-green color. The results showed arsenic, chromium, mercury, selenium, vanadium, and aluminum at elevated concentrations, with the arsenic concentrations at 2,700 µg/L and 2,800 µg/L in the unfiltered and filtered samples, respectively.

- The sample from well GM-13D indicated the presence of arsenic at 180 µg/L in both the unfiltered and filtered samples. The samples also showed the presence of vanadium at 28 and 27 µg/L, respectively, and a pH of 9.28. This well has been compromised by siltation or some other blockage to the point where only the top few feet of the screened interval is unblocked.

- Two wells that hadn’t been previously sampled for metals showed potential indications of current red mud impacts to the fresh ground water in the upper Kingshill aquifer:

    - Well VW25, located downgradient (south) of RMA and east of the RMS and completed in the upper Kingshill aquifer, showed estimated arsenic concentrations of 17 µg/L and 8.3 µg/L in the unfiltered and filtered samples, respectively. The unfiltered result exceeds the MCL (10 µg/L) and the filtered result is close. Chromium was detected in the unfiltered sample at a concentration of 41 µg/L (below the MCL of 100 µg/L), and vanadium was detected in both samples at concentrations of 77 µg/L and 42 µg/L, respectively (there is no MCL for vanadium). The unfiltered sample also exceeded the secondary MCL for iron (300 µg/L) with a concentration of 940 µg/L.

- The unfiltered sample from well VW37, located along the western edge of RMA and completed in the upper Kingshill aquifer, showed the presence of chromium at 5.1 µg/L and also showed exceedances of the secondary MCLs for aluminum and iron.

- Mercury and selenium were detected only in the ground water samples from monitoring well GM-22.

- Antimony, cadmium, and silver were not detected in any of the ground water samples.

- Some forms of arsenic are more subject to leaching and have greater solubility with increasing pH. The high arsenic concentrations detected in filtered ground water and leachate samples collected at the Site seems to be indicative of these phenomena.

Radiological Isotopes:

EPA analyzed seven unfiltered groundwater samples from on-site monitoring wells for radiological analyses for radium, thorium, and uranium. The analytical results of these analyses indicate the following:

- Ra-226 results ranged from non-detect to 0.3 pCi/L. Ra-228 was not detected.

- Th-230 results ranged from non-detect to 0.2 pCi/L. Th-232 was not detected.

- U-234 results ranged from non-detect to 1.6 pCi/L, U-235 results ranged from non-detect to 0.3 pCi/L, and U-238 results ranged from 0.1 to 1.4 pCi/L.

5 Conclusion

The results of the September 2011 EPA sampling investigation at the Site show that migration of red mud and related contaminants from source areas continues to have an impact on downstream water bodies and ground water in the Kingshill aquifer and overlying units. The contamination poses a potential threat to receptor areas, including mangrove wetland areas, waterbird and endangered/threatened species habitats, fisheries, and fresh ground water in the Kingshill aquifer. The Site conditions and analytical results, as presented in Sections 3 and 4, provide evidence of hazardous substance migration in both the surface water and ground water pathways from on-site disposal areas.

5.1 Source Areas

The uncontained waste material in the four identified sources at the Site showed elevated levels of pH, inorganic contaminants, and radioisotopes. The red mud and runoff water in all three red mud disposal areas generally showed pH ranging from approximately 9.5 to 12.5, compared to background pH levels of approximately 7 to 8.5. The highest observed pH readings (above 12.5) were found in Red Mud Disposal Area A and Red Mud Disposal Area B. The waste material also showed the highest concentrations of inorganic and radiological contaminants of concern. The highest concentrations of vanadium and chromium were observed in the red mud waste from Red Mud Disposal Area A and Red Mud Disposal Area B, and the highest arsenic levels were detected red mud leachate (well GM-22) and ash from the Ash Disposal Pond. The highest activity levels for radioisotopes were found in the red mud waste from Red Mud Disposal Area A and Red Mud Disposal Area B.

5.2 Surface Water Migration Pathway

At the time of the EPA investigation in 2011, approximately 2.5 million gallons per day of process water from desalination and storm water flowed through the cooling ponds. The recent cessation of desalination in 2012 has reduced this flow to include only storm water. The primary overland drainage pathways to surface water at the Site originate from Red Mud Disposal Area A and flow south through the RMA Depositional Area and Red Mud Settling Pond to the Upper Cooling Pond, and subsequently to the Lower Cooling Pond. Overland drainage from Red Mud Disposal Area B discharges north and west to the Upper Cooling Pond and south to the Lower Cooling Pond. The southern drainage pathway is partially fed by a man-made drainage ditch that originates at the Ash Disposal Pond and flows south through areas of exposed red mud within Red Mud Disposal Area B. The Lower Cooling Pond discharges to Alucroix Channel via a permitted discharge outfall and possibly to the coastal mangrove wetland area via culverts observed by EPA.

Historically, the West Ditch also acted as a drainage pathway from Red Mud Disposal Area A directly to the coastal mangrove area; the West Ditch has since been diverted through the Lower Cooling Pond. The drainage pathway from the Former Bauxite Storage Shed is south-southwest to a storm water basin. Water levels in the available monitoring wells also suggest the possibility

of an eastern component to shallow ground water flow from Red Mud Disposal Area B, the Ash Disposal Pond, and the Former Bauxite Storage Shed toward Alucroix Channel.

Aerial photographs and on-site observations show the migration of red mud from the disposal areas throughout past and current on-site drainage pathways. Red mud is clearly present throughout the Red Mud Settling Pond and Upper Cooling Pond, within a large portion of the Lower Cooling Pond, and intermittently within the West Ditch and coastal mangrove wetland areas. The red mud in the West Ditch and coastal mangrove wetland areas is believed to be residual contamination from prior releases. Analytical results for contaminants of concern (pH, arsenic, chromium, mercury, selenium, vanadium, and radioisotopes of radium and thorium) verify the downstream transport of red mud and relative dilution with distance from the sources. Site-related contaminants were detected at concentrations above background throughout the Red Mud Settling Pond and Upper Cooling Pond, and in some areas of the Lower Cooling Pond, West Ditch, Alucroix Channel, and coastal mangrove wetland areas.

The downstream surface impoundments and other water bodies include sensitive environmental receptors that are affected or potentially threatened by contaminant migration from the original source areas. In addition to the coastal mangrove wetland areas, the West Ditch, Lower Cooling Pond, and Alucroix Channel are bordered by mangrove wetlands. The Upper Cooling Pond is also bordered by mangrove wetlands, however, the vegetation along this surface impoundment is sparser than the rest. The coastal area, including the Lower Cooling Pond, provides habitat for fish and waterbirds such as brown pelicans and egrets. The south shore of St. Croix, including the Site and vicinity, is a regularly-used fishery and it provides habitat for federally-designated threatened and endangered species (green, hawksbill, and leatherback sea turtles).

5.3 Ground Water Migration Pathway

The historical and recent ground water data for the Site indicate that site contaminants from on-site disposal areas have had an impact on ground water and pose a threat to the underlying Kingshill aquifer, but the nature and extent of the impacts are not fully understood. The analytical results show approximate order of magnitude changes progressing through red mud leachate in overlying fill, Lagoonal Clay underlying the southern portion of the Site, and the Kingshill aquifer beneath the northern portion of the Site. As shown in previous studies, this aquifer is a viable source of fresh water at the Site despite the presence of the saltwater interface near the head of Alucroix Channel. Additional ground water investigation (i.e., a Remedial Investigation) at the Site is warranted to delineate the extent of the impact of red mud and the location of the saltwater interface, as described in the WESTON/EPA document titled *Ground Water Assessment Summary, St. Croix Alumina (Renaissance Park) Site, St. Croix, U.S. Virgin Islands (RAR),* dated May 2012.

Table 8
Stratigraphy and Aquifer Determinations from Monitoring Well Logs
St. Croix Alumina (Renaissance Park) Site

Well Name	Date Installed	Latitude	Longitude	TOC Elev (ft MSL)	Grd Elev (ft MSL)	Screen Interval (ft bgs)		Log Description of Screened Interval	Aquifer
						Top	Bottom		
G-1	1982	17.696331	-64.783892	90.42		90	105	MARL (carbonate clay/silt/sand w/limestone lenses, masses). LIMESTONE (hard/crystalline to weathered; fractures filled with sand/silt/clay); yellow to tan; moderately permeable (95')	Kingshill
G-2 *	1982	17.708152	-64.777952	21.06		20	35	interbedded LIMESTONE (fractured to very hard), coarse CARBONATE SAND/GRAVEL, and CLAY w/silt/sand/limestone chunks; white to brown, some red staining; very low permeability to permeable	Kingshill
G-3	1982	17.717438	-64.770285	81.77		85	100	interbedded CARBONATE SAND, CLAY, and CALCARENITE; white to yellow; loose to cohesive; low to moderate permeability	Kingshill
G-4	1982	17.711120	-64.768691	26.47		26	36	CARBONATE SAND/GRAVEL w/limestone lenses, minor silt/clay; lt-gray to tan; loose, permeable; void or very loose at 30'	Kingshill
G-5	1982	17.708269	-64.767664	11.25		12	20	CARBONATE SAND/GRAVEL w/minor silt/clay; thin calcarenite lens at 12'; tan, loose, permeable	Kingshill
G-6 *	1982	17.704928	-64.761185	8.81		22	30	CARBONATE SAND/GRAVEL, minor clay, shell/coral fragments; white to beige; loose, permeable (Note: lagoon clay 8'-22')	Lagoonal Clay/ Kingshill
G-7	1982	17.705982	-64.781723	25.45		25	35 **	interbedded CARBONATE SAND, CLAY, and weathered LIMESTONE; white to orange; loose to cohesive; low permeability to permeable	Kingshill
G-8	1982	17.705335	-64.783274	23.83		27	45	interbedded CLAY, CARBONATE SAND/GRAVEL, and LIMESTONE; white to orange; low to high porosity and permeability	Kingshill
G-9	1982	17.715494	-64.775525	105.59	104.02	105	125	CARBONATE SILT/SAND w/LIMESTONE chunks/lenses; occasional 1-inch clay seams; white to pale-yellow; loose to moderately cohesive; moderately to very permeable	Kingshill
G-10 *	1982	17.698325	-64.778873	10.81		15.5	23.5	CLAY w/abundant SILT, SAND, and weathered LIMESTONE chunks; brown to beige-gray; low permeability	Lagoonal Clay

All results are in micrograms per kilogram (µg/kg).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
Detections below the adjusted CRQL are in *Italic* .

All results are in micrograms per kilogram (µg/kg).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
Detections below the adjusted CRQL are in*Italic* .

All results are in micrograms per liter (µg/L).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
Detections below the adjusted CRQL are in *Italic* .
Detections above the adjusted CRQL are in **BOLD**.

All results are in micrograms per kilogram (µg/kg).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
Detections below the adjusted CRQL are in *Italic* .
Detections above the adjusted CRQL are in **BOLD**.

All results are in micrograms per liter (µg/L).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
R = The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
Detections below the adjusted CRQL are in *Italic* .
Detections above the adjusted CRQL are in **BOLD**.

All results are in micrograms per liter (µg/L) unless otherwise noted.
AWQC = Ambient Water Quality Criteria (recommended for protection of aquatic life and human health, saltwater chronic)
U = The analyte was not detected at or above the Reporting Limit.
J = The identification of the analyte is acceptable; the reported value is an estimate.
K = The identification of the analyte is acceptable; the reported value may be biased high.
L = The identification of the analyte is acceptable; the reported value may be biased low.
$D^{\#}$ = Dilution was performed for analysis, # indicates dilution factor.
Contaminants of concern detected above the Reporting Limit are in **BOLD**.
Shading indicates exceedance of AWQC for contaminants of concern.

All results are in micrograms per liter (µg/L) unless otherwise noted.
AWQC = Ambient Water Quality Criteria for saltwater (shading indicates exceedance for contaminants of concern)
U = The analyte was not detected at or above the Reporting Limit.
J = The identification of the analyte is acceptable; the reported value is an estimate.
K = The identification of the analyte is acceptable; the reported value may be biased high.
L = The identification of the analyte is acceptable; the reported value may be biased low.
$D^{\#}$ = Dilution was performed for analysis, # indicates dilution factor.
Contaminants of concern detected above the Reporting Limit are in **BOLD**.

All resuts are in miligrams per kilogram (mg/kg) unless otherwise noted.
U = The analyte was not detected at or above the Reporting Limit.
J = The identification of the analyte is acceptable; the reported value is an estimate.
$D^{\#}$ = Dilution was performed for analysis, # indicates dilution factor.
Contaminants of concern detect above the Reporting Limit are in **BOLD**.

%Silt + % Clay/Colloids (%Total Fines)	85	81	88	83	83	77	67	31.1	34	22.8	32.7

TOC results are in milligrams per kilogram (mg/kg)
Grain-size results are in % by weight.
NR = The silt, clay & colloids fractions were too small to report separately, therefore, only the total silt/clay/colloids fraction was reported for these samples.
U = The analyte was not detected at or above the Reporting Limit.
J = The identification of the analyte is acceptable; the reported value is an estimate.

Notes

RMA = Red Mud Disposal Area A

RMB = Red Mud Disposal Area B

WWTP = Waste Water Treatment Plant

urem/hr = micro rem per hour, where rem = Roentgen Equivalent Man

2x2 NaI = 2-inch by 2-inch sodium iodide (NaI) probe

"pm" suffix of some screening readings indicates an afternoon/end of day reading at the Command Post

(a) Estimated using the Bi-212 or when Bi-212 is not reported using the Pb-212 or Tl-208 with the assumption of secular equilibrium..
(b) Estimated using the Bi-214 or when Bi-214 is not reported using the Pb-214 with the assumption of secular equilibrium.
(c) Estimated using the Ac-228 energy peak.
(d) Estimated using the Pa-234m or when Pa-234m is not reported using the Th-234 with the assumption of secular equilibrium.
NR - Not Reported, NA - Not Applicable, Q= No duplicate result available
ND - Non-Detectable (DUP) - Laboratory Duplicate
U - Isotope was not detected above the noted MDC

(a) Estimated using the Bi-212 or when Bi-212 is not reported using the Pb-212 or Tl-208 with the assumption of secular equilibrium..
(b) Estimated using the Bi-214 or when Bi-214 is not reported using the Pb-214 with the assumption of secular equilibrium.
(c) Estimated using the Ac-228 energy peak.
(d) Estimated using the Pa-234m or when Pa-234m is not reported using the Th-234 with the assumption of secular equilibrium.
NR - Not Reported, NA - Not Applicable, J - Reported value is estimated, Q - duplicate analysis not reported
(DUP) - Laboratory Duplicate

(DUP) - Laboratory Duplicate

(a) Sum of radium 226 and radium 228.

(b) Sum of uranium 234, uranium 235 and uranium 238.

(c) Activity to mass conversion factors range from 0.67 to 1.5 pCi/µg (USEPA 2000. National Primary Drinking Water Regulations; Final Rule 65 FR 236; December 7, 2000) and the major challenge is to determine which factor is most appropriate to use to calculate an exposure point concentration for compliance monitoring or to use in a human health risk assessment. Ideally the activity to mass ratio should be calculated for each water supply but if this is not possible, there is a health protective approach to evaluate compliance with the regulatory level. A two-tiered approach can be used to initially screen for compliance with the regulatory level. The first tier involves using a conservative activity to mass ratio of 0.67 pCi/µg to convert activity units in pCi to mass units in µg. The second tier would be to determine the actual activity to mass ratio for a particular water supply. For our screening purpose the first tier was used. If concentrations are less than 30 µg/L, then the uranium MCL has been met and no need to go to the second tier.

Table 8
Stratigraphy and Aquifer Determinations from Monitoring Well Logs
St. Croix Alumina (Renaissance Park) Site

Well Name	Date Installed	Latitude	Longitude	TOC Elev (ft MSL)	Grd Elev (ft MSL)	Screen Interval (ft bgs)		Log Description of Screened Interval	Aquifer
						Top	Bottom		
G-1	1982	17.696331	-64.783892	90.42		90	105	MARL (carbonate clay/silt/sand w/limestone lenses, masses). LIMESTONE (hard/crystalline to weathered; fractures filled with sand/silt/clay); yellow to tan; moderately permeable (95')	Kingshill
G-2 *	1982	17.708152	-64.777952	21.06		20	35	interbedded LIMESTONE (fractured to very hard), coarse CARBONATE SAND/GRAVEL, and CLAY w/silt/sand/limestone chunks; white to brown, some red staining; very low permeability to permeable	Kingshill
G-3	1982	17.717438	-64.770285	81.77		85	100	interbedded CARBONATE SAND, CLAY, and CALCARENITE; white to yellow; loose to cohesive; low to moderate permeability	Kingshill
G-4	1982	17.711120	-64.768691	26.47		26	36	CARBONATE SAND/GRAVEL w/limestone lenses, minor silt/clay; lt-gray to tan; loose, permeable; void or very loose at 30'	Kingshill
G-5	1982	17.708269	-64.767664	11.25		12	20	CARBONATE SAND/GRAVEL w/minor silt/clay; thin calcarenite lens at 12'; tan, loose, permeable	Kingshill
G-6 *	1982	17.704928	-64.761185	8.81		22	30	CARBONATE SAND/GRAVEL, minor clay, shell/coral fragments; white to beige; loose, permeable (Note: lagoon clay 8'-22')	Lagoonal Clay/ Kingshill
G-7	1982	17.705982	-64.781723	25.45		25	35 **	interbedded CARBONATE SAND, CLAY, and weathered LIMESTONE; white to orange; loose to cohesive; low permeability to permeable	Kingshill
G-8	1982	17.705335	-64.783274	23.83		27	45	interbedded CLAY, CARBONATE SAND/GRAVEL, and LIMESTONE; white to orange; low to high porosity and permeability	Kingshill
G-9	1982	17.715494	-64.775525	105.59	104.02	105	125	CARBONATE SILT/SAND w/LIMESTONE chunks/lenses; occasional 1-inch clay seams; white to pale-yellow; loose to moderately cohesive; moderately to very permeable	Kingshill
G-10 *	1982	17.698325	-64.778873	10.81		15.5	23.5	CLAY w/abundant SILT, SAND, and weathered LIMESTONE chunks; brown to beige-gray; low permeability	Lagoonal Clay
G-11	1982	17.709319	-64.771478	37.89	34.61	37	55	CARBONATE SAND/GRAVEL/SILT/CLAY w/LIMESTONE chunks (porous); white to pale-gray; low permeability to loose, permeable	Kingshill
G-12 *	1982	17.708723	-64.782722	47.76		54	64	CARBONATE SAND/GRAVEL w/lge LIMESTONE chunks/lenses (weathered porous calcarenite); pink to yellow-beige; loose to very loose, permeable	Kingshill
GM-13	Jun-95	17.708611	-64.777741	23.28		5	15	SILT/CLAY, little to some fine sand, trace to little limestone fragments; brown; cohesive to slightly cohesive	Lagoonal Clay
GM-13D	Jun-95	17.708374	-64.777854	23.12	20.92	50	90 **	LIMESTONE (gravel-size fragments w/some silt); lt-gray to white-gray. CLAY/SILT, lagoonal [sic]; lt-bluish-gray (76')	Kingshill
GM-14	Jun-95	17.706175	-64.771818	10.49	7.89	8	33	SILT/CLAY, trace to little vf sand and gravel; blue-gray to lt-green-gray to brown w/black streaks; soft and cohesive to dense and moderately cohesive. LIMESTONE, weathered, silt to gravel-size; chalky white (31.5')	Lagoonal Clay/ Kingshill

* These wells are reported to have been destroyed.
** As-built depth; these wells are currently silted/blocked.

All results are in micrograms per kilogram (µg/kg).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
Detections below the adjusted CRQL are in *Italic* .

All results are in micrograms per kilogram (µg/kg).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
Detections below the adjusted CRQL are in*Italic* .

All results are in micrograms per liter (µg/L).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
Detections below the adjusted CRQL are in *Italic* .
Detections above the adjusted CRQL are in **BOLD**.

All results are in micrograms per kilogram (µg/kg).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
Detections below the adjusted CRQL are in *Italic* .
Detections above the adjusted CRQL are in **BOLD**.

All results are in micrograms per liter (µg/L).
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit (i.e., the adjusted CRQL).
UJ = The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
R = The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
Detections below the adjusted CRQL are in *Italic* .
Detections above the adjusted CRQL are in **BOLD**.

All results are in micrograms per liter (µg/L) unless otherwise noted.
AWQC = Ambient Water Quality Criteria (recommended for protection of aquatic life and human health, saltwater chronic)
U = The analyte was not detected at or above the Reporting Limit.
J = The identification of the analyte is acceptable; the reported value is an estimate.
K = The identification of the analyte is acceptable; the reported value may be biased high.
L = The identification of the analyte is acceptable; the reported value may be biased low.
$D^{\#}$ = Dilution was performed for analysis, # indicates dilution factor.
Contaminants of concern detected above the Reporting Limit are in **BOLD**.
Shading indicates exceedance of AWQC for contaminants of concern.

All results are in micrograms per liter (µg/L) unless otherwise noted.
AWQC = Ambient Water Quality Criteria for saltwater (shading indicates exceedance for contaminants of concern)
U = The analyte was not detected at or above the Reporting Limit.
J = The identification of the analyte is acceptable; the reported value is an estimate.
K = The identification of the analyte is acceptable; the reported value may be biased high.
L = The identification of the analyte is acceptable; the reported value may be biased low.
$D^{\#}$ = Dilution was performed for analysis, # indicates dilution factor.
Contaminants of concern detected above the Reporting Limit are in **BOLD**.

All resuts are in miligrams per kilogram (mg/kg) unless otherwise noted.
U = The analyte was not detected at or above the Reporting Limit.
J = The identification of the analyte is acceptable; the reported value is an estimate.
$D^{\#}$ = Dilution was performed for analysis, # indicates dilution factor.
Contaminants of concern detect above the Reporting Limit are in **BOLD**.

%Silt + % Clay/Colloids (%Total Fines)	85	81	88	83	83	77	67	31.1	34	22.8	32.7

TOC results are in milligrams per kilogram (mg/kg)
Grain-size results are in % by weight.
NR = The silt, clay & colloids fractions were too small to report separately, therefore, only the total silt/clay/colloids fraction was reported for these samples.
U = The analyte was not detected at or above the Reporting Limit.
J = The identification of the analyte is acceptable; the reported value is an estimate.

Notes

RMA = Red Mud Disposal Area A

RMB = Red Mud Disposal Area B

WWTP = Waste Water Treatment Plant

urem/hr = micro rem per hour, where rem = Roentgen Equivalent Man

2x2 NaI = 2-inch by 2-inch sodium iodide (NaI) probe

"pm" suffix of some screening readings indicates an afternoon/end of day reading at the Command Post

(a) Estimated using the Bi-212 or when Bi-212 is not reported using the Pb-212 or Tl-208 with the assumption of secular equilibrium..
(b) Estimated using the Bi-214 or when Bi-214 is not reported using the Pb-214 with the assumption of secular equilibrium.
(c) Estimated using the Ac-228 energy peak.
(d) Estimated using the Pa-234m or when Pa-234m is not reported using the Th-234 with the assumption of secular equilibrium.
NR - Not Reported, NA - Not Applicable, Q= No duplicate result available
ND - Non-Detectable (DUP) - Laboratory Duplicate
U - Isotope was not detected above the noted MDC

(a) Estimated using the Bi-212 or when Bi-212 is not reported using the Pb-212 or Tl-208 with the assumption of secular equilibrium..
(b) Estimated using the Bi-214 or when Bi-214 is not reported using the Pb-214 with the assumption of secular equilibrium.
(c) Estimated using the Ac-228 energy peak.
(d) Estimated using the Pa-234m or when Pa-234m is not reported using the Th-234 with the assumption of secular equilibrium.
NR - Not Reported, NA - Not Applicable, J - Reported value is estimated, Q - duplicate analysis not reported
(DUP) - Laboratory Duplicate

(DUP) - Laboratory Duplicate

(a) Sum of radium 226 and radium 228.

(b) Sum of uranium 234, uranium 235 and uranium 238.

(c) Activity to mass conversion factors range from 0.67 to 1.5 pCi/µg (USEPA 2000. National Primary Drinking Water Regulations; Final Rule 65 FR 236; December 7, 2000) and the major challenge is to determine which factor is most appropriate to use to calculate an exposure point concentration for compliance monitoring or to use in a human health risk assessment. Ideally the activity to mass ratio should be calculated for each water supply but if this is not possible, there is a health protective approach to evaluate compliance with the regulatory level. A two-tiered approach can be used to initially screen for compliance with the regulatory level. The first tier involves using a conservative activity to mass ratio of 0.67 pCi/µg to convert activity units in pCi to mass units in µg. The second tier would be to determine the actual activity to mass ratio for a particular water supply. For our screening purpose the first tier was used. If concentrations are less than 30 µg/L, then the uranium MCL has been met and no need to go to the second tier.

"Rite in the Rain®"
ALL-WEATHER WRITING PAPER

ALL-WEATHER
ENVIRONMENTAL FIELD BOOK

Name WESTON SOLUTIONS, INC.

Address 205 CAMPUS DRIVE
EDISON NJ 08837

Phone 732-417-5800

Project ST CROIX ALUMINA (RENAISSANCE PARK)
KINGSHILL, ST CROIX, USVI

WO# 20405.012.013.1455.00

This book is printed on "Rite in the Rain" All-Weather Writing Paper - A unique paper created to shed water and enhance the written image. It is widely used throughout the world for recording critical field data in all kinds of weather. For best results, use a pencil or an all-weather pen.

Specifications for this book:

Page Pattern		Cover Options	
Left Page	Right Page	Polydura Cover	Fabrikoid Cover
Columnar	1/4" Grid	Item No. 550	Item No. 550F

Location St Croix, USVI Date 06/01/11
Project / Client St Croix Alumina / EPA

1135 Rad Meter Ludlum Model 12
S/N #125298; Probe Model 44-9
Background (CUG 60) = 40-60 cts/minute
1145 West side of RM Area A
- Wet red mud at outer base showed 100 cts/minute on Rad meter w/ pan cake probe
- Erosion channels on top of pile
  → 100-200 cpm alpha/beta at the ground surface
  → ~100 cpm gamma
  → Breathing zone < 2x background
1215 Arrived at RM Disposal Area B
- Old wet disposal area; flat ground
- Access road through middle, whole area is walkable
- Rad meter above background (~80 cpm)
1230 Driving tour done, back to Admin offices
1240 EPA, DPNR, and Weston off site. Return at 1430 today.
1300 Bethlehem Village - EPA will stay here for meeting, Weston - lunch and windshield survey

6/1/11

Location St Croix USVI Date 06/01/11
Project / Client St Croix Alumina / EPA

1345 Weston drove around Bethlehem Village and Profit Hills subdivisions - housing
- 200 units (rentals)
- ~500 people total
- Rent through VI Govt, HUD housing (FHA)
- Some ~~units~~ structures appear to be multiple units
- Parking lots give access to many units closest to the site
1420 Weston met EPA back at the site gate. Dave R and George P into the Diageo facility (gate next to SCRG).
1425 Info from Lcdr Acosta about residential com
- 200 units
- 589 residents (270 adults, balance are children
- Built in late 1960s by Harvey Alumina as worker housing
- Managed by DWH (look up acronym)

6/1/11

Location St Croix, USVI Date 6/1/11
Project / Client St Croix Alumina / EPA

1430 More residential info:
- About 120 homes do not receive WAPA water
- Door-to-door survey revealed many health concerns

1445 Met w/ Jeff Sepesi, Zak, and Jay Sheen

1500 Drove to boulders in access road, set out to walk to West Ditch
GPS: - Access road to boulders (line)
- West Ditch, N end (point, offset by 20')

1530 Accessible portions of West Ditch (GPS by Scott)
- West Ditch is perennial
- Minimal stream flow (<10 cfs)
- Classified as water body by DPNR
- South end sediment/soil is coarser than material in middle
- Cut off from its lower (south) portion by overflow pipes, which lead to the Lower Cooling Pond

6/1/11

Location St Croix, USVI Date 6/1/11
Project / Client St Croix Alumina / EPA

1540 Upper Cooling Pond
- MW at southern end
- Overflow pipes (7) at southern end, old - previously used by Martin Marietta to control runoff
- Discharge seeps directly into mangrove area (SW corner of site)
- Observed overflow ("waterfall") from Upper Cooling Pond into stream that flows to Lower Cooling Pond
→ 2.5 MGD from Upper to Lower Cooling Pond (approx.)

1600 Lower portion of the West Ditch - disconnected from northern portion since remediation
- Mangrove area
- GPS point at easiest access
- GPS point at access to mangrove at beach area where RM discharged April 2002

6/1/11

Location ST CROIX, USVI Date 6/1/11
Project / Client ST CROIX ALUMINA / EPA

1610 LOWER COOLING POND
- ABOUT 4' DEEP ⇒ 2' WATER
  2' SILTS
- TILAPIA 6-8" LONG LIVE IN THE LCP
- OBSERVED BROWN PELICAN DIVING FOR FISH INTO THE LCP.

1620 HEAD BACK TO CARS

1640 RECON OF WEST DITCH AND COOLING PONDS (WEST SIDE) COMPLETED
BEGAN RECON OF THE PERIMETER OF RM DISPOSAL AREA A
- GPS OF ACCESS ROAD
- STOP ON NORTH SIDE
- DRAINAGE DITCH AROUND THE RM AREA A FLOWS THROUGH CULVERTS ON SOUTH SIDE, INTO RETENTION POND, THEN INTO UPC
- 4 PHOTOS OF THE WASTE SOURCE
  1455-06-01-01: ERODED PILE
  TO -03 " "
  1455-06-01-04: CLOSE-UP W/CRITTER "GAMBOLD"

1720 OFF SITE.

06/1/11

Location ST CROIX, USVI Date 6/2/11
Project / Client ST CROIX ALUMINA / EPA

0800 GERRY GILLILAND (GG) AND SCOTT SNYDER (SS) OF WESTON ARRIVE AT FACILITY GATE TO COMPLETE RECONNAISSANCE OF THE SCA SITE.

0815 SPOKE W/ ILDE ACOSTA (IA) OF EPA; EXPECTS TO ARRIVE IN 10-15 MINUTES.

0825 IA AND DALE ROSOFF (DR) OF EPA ARRIVES - CHECK IN AT GATE

0835 MET W/ JEFF SEPESI AND JAY SHEEN AT ADMIN BLDG. ALSO, COURTNEY DICKENSON OF DPNR

0840 SS CALIBRATES (ZERO CAL) THE MIE DUST MISTER (pDR MODEL) S/N 4301 (WESTON # RFW 24118)

0900 INFO FROM ZAK
- PILES IN STORAGE SHED IS MOSTLY RM, SOME ALUMINA, FROM TANKS UPON SHUTDOWN AND OTHER EQUIPMENT
- COAL STORAGE AREA - INCLUDES RAIN WATER CATCHMENT (UNDERNEATH) WITH A SUMP; CAUGHT W/IN BERM

6/2/11

Location ST CROIX, USVI Date 6/2/11
Project / Client ST CROIX ALUMINA / EPA

0940 AREA B (SOUTHERN PORTION)
- LARGE OPEN AREA, SPARSELY VEGETATED
- CALICHE AND RED MUD VISIBLE AT SURFACE
  - INFO INDICATES THAT THE RM WAS COVERED BY 2' OF CALICHE.
- EXPOSED AREA IN SOUTHERN CELL SHOWS WET RM AT SURFACE
  - CONNECTED TO ASH RETENTION POND BY DITCH
  - READINGS >2x BACKGROUNDS ON RADMETER (PEAK AT 120 CPM)

1005 ASH DISPOSAL AREA
- AT SE CORNER OF RETENTION POND
- BLACK & GRAY BOTTOM ASH EXPOSED AT SURFACE
- BOTTOM ASH DISPOSAL FROM 1982 (WHEN PLANT SWITCHED TO COAL)
  - FLY ASH WAS MIXED WITH RM SLURRY AT ABOUT 1-2%
- READINGS ~90-100 CPM ON RADMETER
  - 9-10 MICR/HR

6/2/11

Location ST CROIX, VI Date 6/2/11
Project / Client ST CROIX ALUMINA / EPA

PHOTO LOG

1455-06-02-01: AREA B, EXPOSED CATCHMENT; DITCH ON RIGHT; LOOKING WEST

1455-06-02-02: LOOKING NORTH FROM EXPOSED AREA ALONG DITCH TO ASH POND

1455-06-02-03: LOOKING NORTH AT ASH POND WHERE DITCH EXITS

1455-06-02-04: ASH DISPOSAL AREA LOOKING W (LANDFILL IN BACKGROUND)

1455-06-02-05: ASH DISPOAL AREA, LOOKING W FROM ACCESS ROAD

1455-06-02-06: TPDES OUTFALL CLOSE-UP - BLUE CRAB

1455-06-02-07: TPDES OUTFALL, LOOKING N AT OUTFALL APPARATUS ON LOWER COOLING POND

1455-06-02-08: LOOKING E. AT DISCHARGE DITCH INTO ALUCROIX CHANNEL

1455-06-02-09: ALUCROIX CHANNEL, LOOKING N. FROM SOUTHERN END

1455-06-02-10: LOOKING SSE FROM SOUTHERN END OF ALUCROIX CHANNEL.

6/2/11

Location St Croix, VI Date 6/2/11

Project / Client St Croix Alumina / EPA

1030 ~~AcuCroix Channel~~ EVG
TPDES Outfall
- Discharge from LCP to AcuCroix Channel
- Automatic release based on water height/pressure

1045 Southern end of AcuCroix Channel
- Pelicans observed on shoreline

1055 Mangrove Lagoon
- Southern end of LCP
- Red-mud staining observed at surface
- Stressed vegetation observed at edge of water and in center

1110 Upper Cooling Pond, southwest corner
- Pelican observed in water
- RM ~~ar~~ EVG all along shoreline

1130 Info from Syed Syedali
Syed.Syedali@DPNR.gov.vi
- Fairplain wellfield is on standby, used last year

EVG

Gerald V. Gibbs 6/2/11

Location St Croix, VI Date 6/2/11

1455-06-02-17: Looking N across the Lower Cooling Pond; pelican on surface

1455-06-02-18: Looking S at RM piles in storage shed

1455-06-02-19: Looking SE across storage shed, from NW corner

1455-06-02-20: Former RM processing, > W

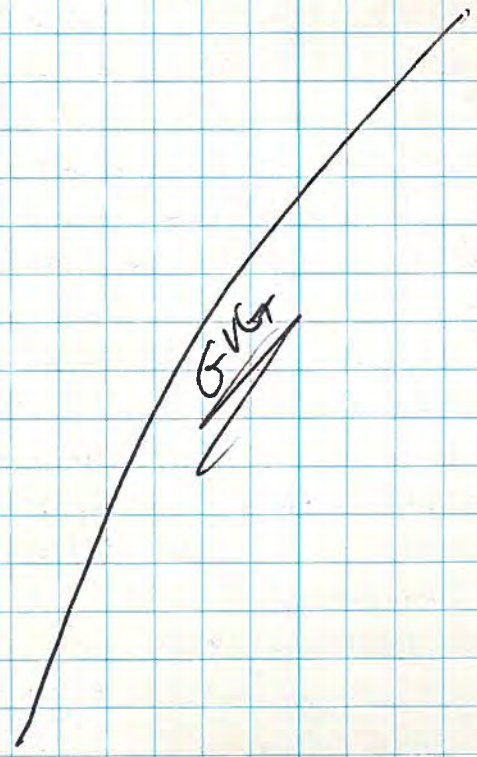
1455-06-02-21: RM settling pond, looking SW toward UCP; note outfall.

Gerald V. Gibbs 6/2/11

Location St Croix, VI Date 6/2/11
Project / Client St Croix Alumina / EPA

1200 Former Bauxite Storage Sheds
- 660' x 2200' x 80'
- Open sides and ends
- Currently there's residual RM and unused bauxite from the time of shutdown
- RAD meters: 80-100 cpm
  - DR's meter - 45-50 MicroR/hr
- Some caliche/concrete piled in here also
- SCRG plans to keep the sheds

1215 RM Transfer Area
- Residual RM 45-50 mR/hr
- Adjacent to settling pond, which then discharges to UCP



1230 RM Disposal Area A
- High point on the site shows view of Bethlehem Village
- Surface is severely eroded, many channels; consists of hard material and dust, variable
  - → hard material is crust from mixture w/ seawater

Gerald V. Gilbert 6/2/11

Project / Client St Croix Alumina / EPA

Photo Log, p. 3

1455-06-02-22: Looking N from RM transfer area to Area A.
1455-06-02-23: RM Area A waste pile
1455-06-02-24: Looking N from high point on RM Area A to residences in Bethlehem Village and Prospect Hills

Gerald V. Gilbert 6/2/11

Location St Croix, VI Date 6/2/11

Project / Client St Croix Alumina / EPA

1315 Back at Admin office, info from ZAK

- Lower cooling pond consists of briny water → salt water
- LCP was dredged in 1994-5
  → spoils went into southern cell of Area B, and spit to east of Area B
- Outfall from ~~the~~ settling pond to UCP is accessible by foot path
  → drive to point just north

Met w/ Jack Thomas, SCRG Brownfields

- He discovered the release to the West Ditch
- Long-term goal is to get a cooling tower, eliminate the cooling ponds (cap them)

1350 Weston and EPA off site. Proceeded separately to DPNR offices at this time.

1400 Lunch in transit

GWC

6/2/11

Location St Croix, VI Date 6/2/11

Project / Client St Croix Alumina / EPA

1445 Weston arrived at DPNR, met w/ Harold Mark. Info re/ Groundwater use:

- All WAPA wells have been inactive since May 2009, when they instalked new reverse-osmosis facility ~~for~~ at the Desalination plant; operates by Seven Seas Corp.
  ⇒ All WAPA drinking water currently comes from a single intake (20'-30' from shoreline)
- GW Program is undertaking a recordkeeping effort for water withdrawal permitting process
- Met w/ Maritza Arauld
  - currently evaluating condition of wellheads
  - water quality is regulated by Env. Health Dept.
  - most wells do not have meters (Marco, Bates - no meters)
    - Mutual homes has meters, but no records

GWC 6/2/11

Location St Croix, VI Date 6/2/11

Project / Client St Croix Alumina / EPA

1515 More info from H. Mark and Marita Arauz

- Mutual Homes is listed in SDWIS
- Water delivery services ("standpipes") are listed in SDWIS as transient systems; estimated 20-25 people each
- Emmanuel's Water Service is drilling a new well in Barren Spot
- She is attempting to obtain well logs from owners and drillers
  - → No well logs available
  - ⇒ If she finds logs, I asked her to email them to me

1530 Met w/ Antonio Lewis

- He enters data in SDWIS
- Has sanitary surveys for many systems - we copied them

DPNR phone # (340) 773-1082

- Mutual Homes, other GW systems are still active.

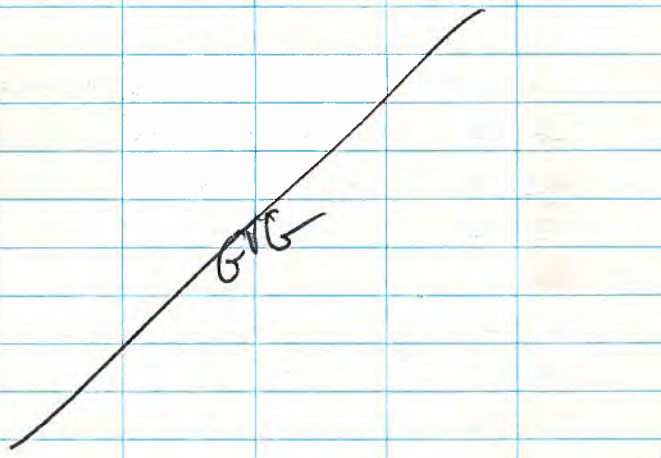
1600 DPNR - Fish & Wetlands

- Met w/ Jed Brown
  Tiffany Cummins
- Nature Conservancy mapped out some wetlands, but resolution wasn't fine enough
  ⇒ Kemmit Louis
- Turtle nesting habitats all along beaches south shore
  - Leatherbacks (mostly W, SW)
  - Green
  - Hawksbill
- Ruth Cay is critical habitat for Ameiva Lizard
  ⇒ ES Specialist: Renata Platenburg
  (340) 775-6762
- St Croix wetlands mapped, Tiffany downloaded her data for us
- Consumption fishing at Krause Lagoon (from dock)
  Great Pond Bay
- Tiffany.cummins@dpnr.gov.vi

Arnold V. Gr 6/2/11



Location St Croix, VI Date 6/2/11

Project / Client St Croix Alumina / EPA

1645 Syed Syedali, Wetlands
- Contractor has site-specific info
- He will get info about the wetlands mapping and contact us.
- Only DPNR inhouse data is island-scale, not site-specific

1715 Harold Mark, DPNR
- Info about street addresses from Comprehensive ~~Zoning & Planning~~ (CVG) & Coastal Zone Planning

1725 Weston left DPNR offices; reconnaissance activities done.

Mobilization for ESI Sampling

The following Weston personnel began mobilization. To ~~the~~ of equipment and supplies to the St Croix Alumina (SCA) site:

Ed Knyer, RST Leader
Alex Byrum, Site Safety Officer
Derrick Cobb, Soil Sampling Team
Michele Lortz, GW/SW/SD Sampling Team
Dan Carlson, Sample Mgmt / Scribe
Joe Schmidl, GW/SW/SD Sampling Team
Gerry Gilligan (arrived 4:30 pm), PM
Anthony Daniele (arrived 5:30 pm)

The property owner has set up their training building as our staging area and command post. The building is located just east of the Administration Building. It is equipped with A/C, WiFi, refrigerator, and bathrooms.

The facility has 24-hour security, everyone must check in at guard house to enter the property.

9/8/11

Location St. Croix, VI Date 9/9/11

Project / Client St. Croix Alumina / EPA

MOBILIZATION & WETLAND FRONTAGE

0740 WESTON ARRIVED ON SITE TO CONTINUE MOBILIZATION.

0800 MALVINA JACKSON OF SCRG (HR DIRECTOR) CONDUCTED THE FACILITY ORIENTATION MEETING FOR ALL WESTON EMPLOYEES (SEE PREVIOUS PAGE). - SEE HAND-OUTS IN FILE FOR DETAILS

0830 ORIENTATION MEETING COMPLETED. WESTON CONTINUED EQ/SUPPLY MOBE.

0930 ALPHONSUS DENIS OF SCRG ESCORTED WESTON MEMBERS G. GILLILAND, J. SCHMIDL, AND M. LORTZ TO THE THREE INTERNAL GATES AT THE FACILITY. ALL GATE OPENINGS MUST BE REPORTED TO SECURITY AND RECORDED IN THE LOGBOOK PROVIDED.

1030 BACK AT COMMAND POST; J. SCHMIDL AND M. LORTZ PREPARING FOR WETLAND WORK.

1200 JS & ML DEPART FOR WETLANDS EVALUATION. SEPARATE LOGBOOK BY JOE SCHMIDL.

1330 DC & GG OFF SITE FOR SUPPLIES/LUNCH. OTHERS TAKING INVENTORY. STILL WAITING FOR MUCH EQ (SHOULD ARRIVE TODAY, ACCORDING TO FEDEX TRACKING).

9/9/11

Location ST CROIX, VI Date 9/9/11

Project / Client ST CROIX ALUMINA / EPA

NOTE: ILDEFONSO ACOSTA, EPA, CALLED EARLIER TODAY TO NOTIFY US THAT EPA (ALL) WILL NOT ~~ARRIVE UNTIL~~ TRAVEL UNTIL MONDAY DUE TO TS MARIA. ⇒ BEGIN RAD SCREENING TUESDAY.

1430 FOLLOW-UP: DAVE ROSOFF AND MIKE FERRIOLA CALLED:

- MIKE WILL BE ARRIVING AT ~2:30 MONDAY AFTERNOON; WHEN HE ARRIVES, HE WILL NEED HELP GETTING ~~THE~~ THE EQ FROM UPS TO SITE - SEND 2 VEHICLES.
- OK TO BEGIN SW/SD SAMPLING IN MANGROVE AND CHANNEL AREAS; ALSO BG SOIL SAMPLING.
- OTHER EPA PERSONNEL WILL ARRIVE TUESDAY MORNING AT SITE

1500 WESTON CONTINUED MOBILIZATION TO SITE - TRACKING DOWN EQ HUNG UP AT UPS AND SHIPMENTS ARRIVING TODAY

1800 ALL WESTON PERSONNEL OFF SITE.

9/9/11

Location St Croix, VI Date 9/10/11

Project / Client St. Croix Alumina / EPA

Mobilization & Well Recon & pH Prelim

0800 Weston arrived on site (GG, EK, JS, DC, AD, ML, DCobb, and Aaron)
- Weather: partly cloudy, showers, hot - humid; TS Maria expected later.
- AB conducts brief safety meeting
- Mobilizing eq/supplies, which arrived at Hotel last night.

0830 Rearranged command post for logical progression of work activities.
- DC doing scribe
- Sampling eq at front, sample mgmt will come through back door.

0900 GG notified Zak - Weston to collect # samples for pH procedure testing today - also measuring DTW and depth of wells. Zak says OK.

0930 JS & AD out to get reference samples for pH testing.
- ML & DCobb steam-cleaning w/l probe and o/w probe

1000 ML & DCobb out to locate remainder of wells, measure w/levels and depth
- JS and AD return w/ reference soil; Red

GG 9/10/11

Location St Croix, VI Date 9/10/11

Project / Client St Croix Alumina / EPA

1030 JS & AD also tested pH of puddle ~~at~~ at RMA pile w/ pH paper = 10-11 (see below for more)

1045 JS & AD back to collect water for pH testing w/ meter
- pH = 10.19

1100 pH readings of RMA samples
- RMA from pile = 10.1
- Red soil across road from pile = 8.64

1115 ~~Tests~~ end Nitric acid volume test for Red Mud puddle water
- 60 mL to bring pH from 10.19 to 1.5

1130 ML & Cobb out to hardware store and continue well recon (separate GW logbook)

1140 Alex B out to scope out Route-to-Hospital

1300 Activities for this afternoon include further pH preliminary evaluations (AD & JS) and continuation of well recon (ML & DCobb). Others working SMO & safety details.

GG 9/10/11

Location ST CROIX, VI Date 9/10/11

Project / Client ST CROIX ALUMINA / EPA

1430 PH READINGS (METER-TESTED):
- RED MUD SETTLING POND = 9.71
- UPPER COOLING POND, SOUTH END = 8.22
- LOWER COOLING POND, NW CORNER = 8.17

⇒ EXPECT ALL SW SAMPLES TO BE NON-DG

1500 AD, D CARLSON, & JS OFF SITE; EK & GG PICK UP LUNCH

1530 EK & GG RETURN

1600 NOTES RE GW WELLS (SEE GW LOGBOOK FOR MORE DETAILS):
- GM-22: BURIED BY LIMESTONE RUBBLE?
- G-1: DAMAGED, NO INNER CASING, AND SILTED UP (ONLY ~1' OF WATER)
- H-1: 6" OF FLOATING PRODUCT
- G-7: COULD NOT LOCATE; TRY AGAIN MONDAY
- GM-13D: RED-MUD WASHOUT AREA

1600 AB, ML, & D COBB OFF SITE

1700 EK & GG OFF SITE.

9/10/11

Location ST CROIX, VI Date 9/12/11

Project / Client ST CROIX ALUMINA / EPA

SW/SD & BG SOIL SAMPLING

0710 WESTON ARRIVED ON SITE TO BEGIN SAMPLING EVENT
- GERRY GILLILAND
- EA KNUFA
- ALEX BYRUM
- JOE SCHMIDL
- DAN CARLSON
- MICHELE CORTE
- DERRICK COBB
- ANTHONY DANIELS

WEATHER: CLOUDY, SHOWERS, ~80°F

0715 OPEN UP COMMAND POST, BEGIN ~~SAFETY~~ GP SET UP

0720 TAILGATE SAFETY MEETING BY A. BYRUM; PRIMARY CONCERNS:
- HEAT STRESS - WEAR HATS, GLASSES, TAKE BREAKS, FLUIDS, SUNSCREEN
- SLIP/TRIP/FALL - PILE & MANGROVES
- CHEMICAL: METALS TOXICITY, AND RAD ISSUES
- DO NOT TRACK RED MUD OFF SITE; KEEP OUT OF & OFF VEHICLES
- BIOLOGICAL HAZARDS (PLANTS & ANIMALS)

9/12/11

Location St Croix, VI Date 9/12/11

Project / Client SCA SITE

0755 SAFETY MEETING ENDED
0800 SAMPLING TEAMS ARE DECONNING AUGERS (FOR BG SOILS) AND PACKING TRUCKS
0900 GG NOTIFIED ZAK ZAKARIA OF SCRG OF TODAY'S SCHEDULED ACTIVITIES (BG SOIL; SW/SD COASTAL/CHANNEL) - OK; RECORD GATE OPENINGS
0910 SYNCH-ING THE GPS DEVICES WITH THE EXISTING ~~WAYPOINTS~~ PROPOSED LOCATIONS FILE.
0930 SAMPLING TEAMS DEPART TO BEGIN SAMPLE COLLECTION
0945 SPOKE W/ ADLY MICHAEL, REGION 2 SAMPLE COORDINATOR:

- METALS (SOIL & AQUEOUS) DO NOT REQUIRE EXTRA VOLUME FOR MS/MSD
- SVOCs & AROCLORS CAN BE COMBINED INTO ONE 8-OZ JAR (SOILS)
- MS/MSD SAMPLES - ONE EXTRA 8-OZ JAR FOR AROCLORS
- HE'S STILL WAITING FOR THE DESA SOIL PERMIT; WILL FORWARD TO US WHEN AVAILABLE - NEED BY TOMORROW.

9/12/11

Location St Croix, VI Date 9/12/11

Project / Client SCA SITE

1030 ANTHONY HAS REPORTED THAT THERE IS A REFUSAL AT @ 4 INCHES AT BG-S01; NO SUBSURFACE SAMPLE
1015 LATE ENTRY: ADLY SENT THE SOIL PERMIT.
1100 ALEX REPORTS REFUSAL AT BG-S02 @ 16 INCHES
1115 THUNDERSTORMS ARE BEGINNING TO MOVE THROUGH OUR AREA, ALONG WITH HEAVY RAINS
1200 TIDES ARE AFFECTING THE COLLECTION OF SOME COASTAL SAMPLES.
1245 AD & DCORE REPORT BACK THAT BACKGROUND LOCATIONS ARE MANGROVE SWAMPS. NO COLLECTION THERE: ~~AT~~ CAN
⇒ BG LOCATIONS BG-S03/4/5/6 MOVE FURTHER NORTH.
1330 DCORE AND AD REPORT BACK THAT THE ENTIRE BACKGROUND AREA CONTAINS ONLY A THIN LAYER OF SOIL (MAX. 16 INCHES) ON TOP OF LIMESTONE
⇒ NO BG SUBSURFACE SOIL SAMPLES (EXCEPT BG-SS02 FROM 16-INCH DEPTH)

9/12/11

Location St Croix, VI Date 9/12/11

Project / Client St Croix Alumina

1340 NOTE: WESTON IS RECORDING PH READINGS AND SMO INFO ON SEPARATE LOG SHEETS.

1430 ALPHONSUS DENIS DROPPED OFF TWO SETS OF KEYS FOR US, TO OPEN GARAGE, TRAINING CTR, INTERNAL GATES → GG SIGNED FOR KEYS.

1455 JS REPORTS THAT THEY'RE HAVING TROUBLE CALIBRATING THE YSI. WE'LL GET PH READINGS BACK HERE AT COMMAND POST, ON SW SAMPLES FOR TODAY

1530 THE SOIL PERMIT FROM DESA IS JUST PAGE 1 - ADLY MICHAEL SAYS IT'S OK TO SHIP THE SAMPLES WITH IT.

1545 ADLY CALLED BACK - OK TO SHIP SAMPLES WITH P-1 OF SOIL PERMIT - WILL CONFIRM W/ LAB DIRECTOR TOMORROW.

1600 WE HAVE ONE COOLER READY TO GO - TO THE DESA LAB.

1610 EK & DANC TO FEDEX W/ FIRST SAMPLE SHIPMENT.

1620 CHECK-IN WITH JS - TWO MORE LOCATIONS TO GO - AD & AB GO TO HELP THEM.

GVG 9/12/11

Location St Croix, VI Date 9/12/11

Project / Client St Croix Alumina

NOTES ON PH PROCEDURES:

- COLLECTING ADDITIONAL VOLUME (EVG) OF EACH SOLID SAMPLE FOR PH READING
- WEIGH 20G AT COMMAND POST
- MIX W/ 20 mL OF DI WATER
- SHAKE 5 MINUTES
- LET STAND >1 HOUR
- READ PH AND TEMP

(SUMMARY OF PH SOP METHOD 9045D - SOIL & WASTE PH)

AQUEOUS SAMPLES:

- COLLECT EXTRA VOLUME, OR DIRECT-READ.
- DIRECT PH READING AT COMMAND POST; TEMP ALSO.
- GW SAMPLES WILL BE LOGGED AT LOCATION, ON PURGE FORMS.

SW/SD Sampling (Day 2) & RMA Prep

0705 Weston arrived at the SCRG facility
- GG, EK, JS, ML, DanC, AD
- AB & DCobb to hardware store for supplies

0715 Setting up at Command Post

0730 Weather partly cloudy, muggy, 80's

0745 GG, JS, & ML go out to recon the background SW/SD samples; access through the landfill.
- All locations are accessible, mangrove swamp area.

0845 Back at command post, Jose Acosta & Nidal Azzam of EPA arrived on site.
- GG fills in Idle on progress
- Waiting for EPA equipment still; DR, MF, CD (EK)

0930 SW/SD teams head out for sampling at Alu Cruz Channel.

Carol K GE 9/13/11

Location St Croix Date 9/13/11

Project / Client St Croix Alumina

0940 GG escorts Ilde Acosta (IA) and Nidal Azzam (NA) to Area B.
1000 IA and NA continue RECON of Area B; GG observes channel sampling (ACC-SW02 location is inaccessible - need machete)
1020 GG back to command post.
EPA has arrived with EQ
Dave Rosoff
Cris D'Onofrio
Mike Ferriola
1030 Nidal & I. Acosta back to command post
- SCRG M. Jackson, Jay
Present orientation for EPA
1100 Planning w/ EPA, and update.
1130 Our plan moving forward:
- EPA to send both teams to RM Area A (pile) to ~~screen~~ perform RAD screening this afternoon
- RAD screening at Lower Cooling Pond, Upper Cooling Pond, and West Ditch, and RM Settling Pond tomorrow morning.

9/13/11

Location St Croix, VI Date 9/13/11

Project / Client St Croix Alumina

1145 EPA preparing the ~~sampling~~ screening equipment; AB & DCobb will join them to flag locations.
1245 SW/SD team has finished collecting ACC samples, except:
- SW02/SW03 inaccessible
⇒ modify location to small outfall stream, as downstream as possible, if possible.
1300 ~~Rod~~ JS & GG prepped samples for pit testing.
1315 EPA & Weston out to RM Area A.
1330 SW/SD team back out to collect BG samples.
1400 GG meets Narcisse Abraham of Malcom Pirnie Inc. (MPI) to open wells.
1415 Opened GM-14 (southern end of old plant, along ACC).
1420 Opened VW-16 (on way to garage) 4-inch, single cased, fiberglass

9/13/11

Location St Croix, VI Date 9/13/11

Project / Client St Croix Alumina

1425 OPENED VW-27 (BEHIND PIPELINE NW FROM COMMAND POST) - 4-INCH SINGLE CASING, FIBERGLASS

1430 OPENED VW-25 (FORMER TANK AREA NW OF MOLASSES TANKS)

1440 OPENED ~~ACCESS~~ MW WELL AT VW-37 (ACCESS ROAD, WEST SIDE OF RMA); 4-INCH MW, FIBERGLASS

1445 VISITED G-7, SOUTH OF VW-37 INSIDE LOCKED GATE OF MONITORING STATION (WEATHER).

1500 SAMPLE MANAGEMENT TO MEET FEDEX DEADLINE (4:30 PM)

1625 DAN, GERRY, & ANTHONY ~~BROUGHT SAMPLES TO FED~~ LEFT SITE FOR FEDEX

1645 RELINQUISHED SAMPLES TO FEDEX

- ORGANICS (SVOCs & PCBs) TO CHEMTECH AIRBILL # 8736 9394 8798
- INORGANICS (METALS, CHLORIDES, TOC, GRAIN SIZE) AIRBILL # 8747 3102 7524

1715 BACK AT SITE. EPA & WESTON ARE DISCUSSING PLANS.

9/13/11

Location St. Croix, VI Date 9/13/11

Project / Client St Croix Alumina

1800 EPA & WESTON PLANS FOR TOMORROW:

- TWO SCREENING/SAMPLING TEAMS IN THE SW/SD LOCATIONS @ LCP & UCP AND WEST DITCH
- STAKING LOCATIONS ON THE PILE (PROPOSED LOCATIONS FROM MAP) AND SCREENING 50' x 50' AROUND EACH
  - ⇒ SAMPLES TO BE COLLECTED AT HOT SPOT WITHIN EACH GRID
  - ⇒ SURFACE AND SUBSURFACE SAMPLES TO BE COLLECTED IN RMA & RMB
- ON SITE AT 0700 TOMORROW.

1830 AB, ML, DCOBB, AD & JS OFF SITE. EPA OFF SITE ALSO.

mud on bank side - E side of ditch
had to accurate GPS location
1700 collected UCP - SW-35
pH = 8.17
Red mud bank, dem water,
red mud in sediments in mud flat
~~3844~~ cpm 6100 cpm
1722 collected WES - SW-24
8.10 = pH
3677 cpm
west ditch - 3-4 ft of standing water
brown/black sediments, seaweed.

Location St Croix VI Date 9/14/11

Project / Client St Croix Alumina

1738 - collected UCP - SW-~~37~~.37.
pH = 8.79
12931 cpm
Red mud, heavy silting, next to
the small island in the UCP.
1800 - Completed sampling for the day.
Drove back to training building w/
5 samples collected.

1820 SW/SD TEAM BACK TO TRAILER,
G GILLILAND TAKES BACK LOGBOOK; REVIEW
LEADS TO FOLLOWING LATE ENTRY:
1828 LATE ENTRY - A. Byrum -
Sediment sample times are
approximately 5 minutes after
the surface water samples at
each separate location.
UCP - SD - 34 - 1625 hrs
WES - SD - 22/23 - 1637 hrs
UCP - ~~SW~~ SD - 35 - 1705 hrs
WES - SD - 24 - 1727 hrs
UCP - SD - 37 - 1743 hrs

9/14/11

Location St Croix, VI Date 9/14/11

Project / Client St Croix Alumina

~~1820~~ 1830 G. GILLILAND TAKES BACK THE LOGBOOK FROM A. BYRUM

- OTHER SW/SD TEAM RETURNS WITH SAMPLES

⇒ LOCATIONS SW39, SW40, ~~SW43~~ SW45, SW41

⇒ SW/SD RAD @ LOCATION SW45

(COLLECTED BY AD & ML)

1900 LATE ENTRY:

DAN C DELIVERED THE REMAINDER OF YESTERDAY'S SAMPLES TO FEDEX, RELINQUISHED AT 1645

- ONE COOLER TO EPA-DESA AIRBILL # 873693948802
- ONE COOLER TO CHEMTECH AIRBILL # 873693948813

1915 GG MET W/ EPA TO DISCUSS TOMORROW'S ACTIVITIES (SEE NEXT PAGE).

1945 WESTON OFF SITE. EPA DEPARTED JUST PRIOR.

9/14/11

Location St Croix, VI Date 9/14/11

Project / Client St Croix Alumina

PLANS FOR 9/15/11 (SW/SD)

1) COLLECT MAN - SW18
MAN - SW19
UCP - SW36
(ADD ORGANICS)
UCP - SW38
WES - SW25
RMS - SW46
RMS - SW47

MOVE RMS - SW42/43 TO NW CORNER OF SETTLING POND

(TOTAL OF 8 LOCATIONS)

DELETE RMS - SW44

2) BEGIN SAMPLING ON RED MUD DISPOSAL AREA A

3) BEGIN AT 7:00 AM

GG

Location ST CROIX, VI Date 9/16/11

Project / Client ST CROIX ALUMINA

0700 WESTON ARRIVED ON SITE

WEATHER: HOT & SUNNY, HIGH 80°Fs

0715 ALEX BYRUM CONDUCTS THE TAILGATE SAFETY MEETING:

- LONG HOURS ON PILE - TAKE MANY BREAKS & FLUIDS
- CONTAIN RED DUST (VERY DRY CONDITIONS ON PILE) ⇒ HIGH PH.
- EXTENDED LUNCH BREAK, OUT OF HEAT FOR AWHILE.

0750 EPA ARRIVED ONSITE: MIKE FERRIOLA AND NIDAL AZZAM

- SOIL TEAM GETTING READY

0800 JS AND DAN C PREPARING SAMPLES FROM YESTERDAY — JS DOING PA PREP & READINGS

0830 TEAM ON SOIL PILE INCLUDES MF & NA FROM EPA w/ EK, AB, DCOBB, ML, & AD FROM WESTON

0935 JS HAS FOUND SEVERAL SAMPLES WITH PH > 11.00 FROM RED MUD AREA A ⇒ DG SHIPPING

LATE ENTRY: JS SCREENED 3 BAGS OF IDW - NO RAD READINGS ABG, @ 0830

9/16/11

Location ST CROIX, VI Date 9/16/11

Project / Client ST CROIX ALUMINA

I, JOE ACOSTA AND DAVE ROSOFF ADDED THE FOLLOWING SAMPLES THIS MORNING, FOR COLLECTION NEXT WEEK:

- 6 SURFACE SOIL LOCATIONS IN DRAINAGE PATHS SOUTH OF RMA AND WEST OF RUINS (MOVE FROM AREA B)
- 4-5 SW/SD SAMPLES IN THE DRAINAGE PATHWAY FROM ASH DISPOSAL POND THROUGH RMB AND INTO LOWER COOLING POND (POSSIBLE)

1030 GG RETRIEVES LOCATIONS FROM THE SOIL TEAM

1200 SOIL TEAM RETURNS - 7 LOCATIONS ALREADY.

1300 PACKAGING THE SAMPLES; JS MAKES THE DECISION TO SHIP SAMPLES AS "PROCESSED BAUXITE"; THEREFORE, SOIL PERMITS SHOULD NOT BE REQUIRED ⇒ APPLIES TO RED MUD ONLY; IF RM IS MIXED W/ SOIL, PERMIT REQUIRED

Gerald V. Gio 9/16/11

Location ST CROIX, VI Date 9/16/11

Project / Client ST CROIX ALUMINA

1500 DR, IA, SCA FLAGGING LOCATIONS - SCREENING RAD - IN AREA B

1515 GG OUT TO MEET FDA

1520 GPS OF RMB-WSTNEW-1 (RAD COUNT ~ 29); SW END OF AREA B ⇒ UPDATED RMB-WST37

1530 RAD SCREENING IN VICINITY OF RMB-WST34 (NO UPDATE; CLOSE ENOUGH)

Location ST CROIX, VI Date 9/17/11

Project / Client ST CROIX ALUMINA

MEETING W/ ~~ADEC~~ DAVE ROSOFF

- AREA B – 15 LOCATIONS IN EXPOSED AREAS
  - ⇒ EACH LOCATION NEEDS 5-6 PHOTOS – DOCUMENT SURROUNDINGS
  - ⇒ ROUGH ESTIMATE OF AREA
  - ⇒ SAMPLES AT DEPTH – HAND AUGER AS DEEP AS POSSIBLE
  - ⇒ UNSURE VS THE MIGRATION OF RM GOING
- ALSO DOCUMENT EROSION FROM AREA B INTO UPPER COOLING POND

1500 THE RED MUD SURVEY TEAM HAS RETURNED TO COMMAND POST.

⇒ DOWNLOAD RAD DATA, THEN EPA DEPARTS

1600 WESTON DEPARTED SITE; EK AND GG REMAINED FOR ANOTHER 1 HOUR.

1700 EK AND GG OFF SITE AND BACK TO HOTEL.

9/17/11

Location St Croix, VI Date 9/19/11

Project / Client St Croix Alumina

0700 WESTON ARRIVES ON SITE ~~TEAMS~~ AND EPA ALSO.

TODAY'S TEAMS:

- RMB SAMPLING - AB, DCOBB, AND AD w/ NIDAL A., MIKE F., AND ILANA
- FBS STORAGE & RMA DRAINAGE - DR & CD OF EPA w/ EK OF WESTON
- ML & JS OF WESTON - GW TEAM

0715 TAILGATE SAFETY MEETING

0735 RMB TEAM OUT TO BEGIN SAMPLING IN AREAS OF EXPOSED RM

0800 TEAM CHANGE - GG ESCORTS DR & CD TO FBS (EK DOING SMO)

- RED MUD MIXED w/ ALUMINA & BAUXITE AT BACK MIDDLE (NOT MUCH); DEBRIS MIXED IN THROUGHOUT
- ALUMINA PILE (WHITE) ~~#~~ PILED AT WEST SIDE;
- BAUXITE MIXED WITH RED MUD AT WEST END; ALUMINA ALSO
- PILE IN FBS DOES NOT EXTEND THROUGHOUT THE SHED

GG 9/19/11

Location St Croix, VI Date 9/19/11

Project / Client St Croix Alumina

0820 RED MUD MOSTLY, SOME RED SAND MIXED IN, AT SURFACE

- NO SATELLITES ON GPS IN FBS THROUGHOUT THIS AREA. (TOP OF PILE)
- HIGHEST RMS SCREENING RESULTS ARE FROM THE PILE; ONE LOWER BOWL IS ~~HIGHER~~ (GW) SIMILAR; EROSION CHANNEL ON EAST SIDE ALSO
- RED MUD MIGRATION OVER SILT FENCE TO SOUTH (BEHIND PILE) TO ~~BLOCKED BY~~ (GW) EXPOSED RM AREA BELOW

0900 ~~MOO~~ (GG) WE FLAGGED 3 POINTS (44-45-46) ON TOP OF PILE. (NO GPS COVERAGE)

- MOVED FBS-WST43 TO ~~#~~ HEAD OF EROSION CHANNEL THROUGH BERM, SOUTH (GW) SIDE OF SHED

FBS Summary

- PILES CONSIST OF A MIXTURE OF RED MUD, ALUMINA, BAUXITE, AND CALICHE/MARBLE; SOME PILES OF DEBRIS
- EVIDENCE OF MIGRATION TO SOUTH - EROSION CHANNEL THROUGH BERM

GG 9/19/11

Location St Croix, VI Date 9/19/11

Project / Client St Croix Alumina

0930 RMA WEST DRAINAGE AREA. THE SOILS IN THIS AREA ALL CONSIST OF RM.
- READINGS IN VEGETATED AREAS ARE NEAR 30,000 CPM.
- DECIDE TO CALL THIS ~~RED MUD AREA~~ (C) NOT ALREADY USED
- READINGS IN CHANNEL ARE ALSO ~~UP TO~~ SOME APPROXIMATELY 25-30 KCPM

1010 FLAGGED/GPS RMC-S11 (PILE IN MIDDLE) - PROPOSED

1030 (APPROX) FLAGGED RMC-S12

1130 FLAGGED RMC-S13 GPS POINT (PROPOSED)

1135 RMC-S14 PROPOSED

1140 ARRIVED AT THE RUINS - SLAVE QUARTERS - THIS ~~AREA~~ AREA IS A LIMESTONE OUTCROP STAINED W/ RED MUD AND W/ RED MUD DEPOSITS IN SOME AREAS.
- RAD SCREENING MEASURES BACKGROUND (~ 4000 CPM)
- RAD (GAMMA) SCREENING IN EXPOSED AREA EAST OF SLAVE QUARTERS = 15-20 CPM

Project / Client ST CROIX ALUMINA

1200 EVALUATION OF RMA WEST DRAINAGE

- ~~COVERS~~ EXTENDS FROM RUINS-~~DRN~~ AREA WEST TO SW CORNER OF RMA (LARGE DISCHARGE PIPE UNDER ROAD)
- THERE ARE DRAINAGE CHANNELS AND ASSOCIATED FLOODPLAINS THROUGHOUT, FROM RMA TO UCP; SHEETFLOW ALSO.
- ENTIRE AREA IS COVERED WITH RED MUD DEPOSITS, RANGING FROM A FEW INCHES TO > 1 FOOT.
  - ⇒ THICK DEPOSITS OF RM ARE APPARENT ON BANKS OF STREAM CHANNELS
- DRAINAGE COMES FROM PIPE DISCHARGE AT WEST END, RUINS-DRAIN-W AT EAST END; SEEPAGE AREAS AND OVERFLOW IN BETWEEN.
- EPA REQUESTED AERIAL INTERPRET TO COMBINE W/ GROUND SURVEY.
- RED MUD OBSERVED W/IN 4' OF SLAVE QUARTERS & W/IN 20' OF FURNACE
- RED MUD SURROUNDS LIMESTONE HILL

9/20/11

Location St Croix, VI Date 9/20/11

Project / Client St Croix Alumina

1315 A Byrum collects sample RMA-SW57
- Red water flowing off RMA
- Sample collected from middle pipe, south side of road
- Collected during lighter rain, but flow estimated ~200 gpm
- pH paper reads 10-11 at flow
- pH of sample = 10.54

1400 IA & GG completed the survey of the RMA West drainage and head back to command post.

1415 GW team at well G-7 to start the afternoon

1515 ML reports that well only has a few feet of water, and it runs dry.
⇒ Purge today, return tomorrow for sample.

1530 Sample management push to make the FedEx run

9/20/11

Location St Croix, VI Date 9/20/11

Project / Client St Croix Alumina

1630 Dan C off to FedEx

1645 Relinquished coolers to FedEx
- DESA, one cooler
  Airbill # 874731024775
- Chemtech, two coolers
  Airbill # 874731024742
- NAREL, one cooler
  Airbill # 874731024764

1730 IA & GG add new samples for tomorrow:
- RMA-SD57 through RMA-SD63 (one duplicate)
  → Rad + Inorganics for all
  → SVOCs/Aroclors for SD57, SD59, and SD62/63
  → Waste samples from the RMA West drainage/overflow area
- Also need to collect BG-SS16 and BG-SS16 (west of site near the landfill WWTP and river out)

9/20/11

Location ST CROIX, VI Date 9/21/11

Project / Client ST CROIX ALUMINA

0700 WESTON ARRIVED ON SITE, AND EPA.

0715 TAILGATE SAFETY MEETING

0730 TODAY'S TEAMS:

- AB, DCOBB, AD, AND IA MF, AND NA - SOIL AND RM SED SAMPLING
- ML & JS - GW SAMPLING
- EK - DG SHIPPING
- DCARLSON & GC - NON-DG SMO (MANY TO PROCESS)

⇒ SAMPLING TEAMS SET OUT

0800 SOIL TEAM BEGINS AT THE BIG LOCATION, THEN WILL WORK THEIR WAY OVER TO RMA LOCATIONS.

⇒ ALSO NEED TO COLLECT THE SAMPLES AT FBS-WST43

0800 EPA TEAM IS DOING THE RADIATION SCREENING IN THE COMMUNITY TODAY. ⇒ RAT SURVEY

0800 NEW SAMPLE NUMBERS CREATED FOR RAD SURVEY HOT SPOTS IN AREA A (RAD ONLY): RMA-WST-R01 & RMA-WST-R02

9/21/11

Location ST CROIX, VI Date 9/21/11

Project / Client ST CROIX ALUMINA

0955 JS CHECKED IN - NO VOLUME/RECOVERY AT WELL G-7

⇒ MUDDY WATER, ONLY 3'

⇒ NO SAMPLE

1100 JS CHECKED IN AGAIN, REPORTED THAT THE PH OF THE WATER IN GM-22 IS 12.5+

⇒ ORGANICS WILL BE SHIPPED AS DANGEROUS GOODS

1145 SAMPLING TEAM DROPPED OFF THE SAMPLES FROM THIS MORNING (RMA-SD57 TO RMA-SD63)

- ADDED SAMPLES; ALTHOUGH LISTED AS SD SAMPLES TO DISTINGUISH FROM RMA PILE, THE SAMPLES CONSISTED OF WASTE MATERIAL (RED MUD)

⇒ MODIFICATION TO WORK PLAN

1250 GW SAMPLING IS COMPLETED ML RETURNS W/ SAMPLES FOR SMO:

- SCA-GW05/SF (WELL GM-13D)
- SCA-GW06/GF (WELL GM-22)

9/21/11

Location St Croix, VI Date 9/21/11

Project / Client St Croix Alumina

Sample Management Issues

pH of sample GW06 = 12.75
(From well GM-22)

⇒ Must go as Dangerous Goods if unpreserved

Preserved metals and filtered metals to pH < 2
⇒ much effervescence; 40 mL

Preserved VOCs w/ HCl
(10-25 drops, not below 2)
Effervesced also

For DG shipping of SVOCs/Aroclors, we transferred samples into 16-oz glass jars to fit the shipping containers. (Sample SCA-GW06)

1300 Sample management - sampling effort is complete

1340 AB, DC, & AD out to measure the Ash Disposal Pond

9/21/11

Location St Croix, VI Date 9/21/11

Project / Client St Croix Alumina

At Disposal Pond

Area measurement (based on GPS) = 35,742 ft²

Depth = 4.5 ft

~~35,742 ft² x 4.5 ft = 54,292 ft³~~

~~= 2010 cy~~ GVG

Transcription of Alex Byrum's notes from RST Logbook #1

1340 Drive to ADP area, measure using the RST-2 Trimble
⇒ Approx. 35,742 ft²

And hand auger for depth - six additional auger holes advanced to refusal @ approx. 4.5' depth

2 holes down to 5' depth to refusal on native rock/soil or water closes hole

Note: Depth ≅ 4.5' average

- Volume estimate of exposed area

35,742 ft² x 4.5 ft = 160,839 ft³

⇒ 160,839 ft³ / 27 ft³/cy = 5957 cy

9/21/11

Location ST CROIX, VI Date 9/21/11

Project / Client ST CROIX ALUMINA

WESTON PACKED SAMPLES AND EQUIPMENT. DUE TO THE FEDEX DEADLINE, SOME SAMPLE SHIPPING WILL WAIT UNTIL TOMORROW.

1800 AD RETRIEVED BLADDER PUMP FROM WELL G-9

Six wells for RAD screening denoted by *

Do not sample VW27 or GM-13.

Carol V. 9/17/11

St Croix Alumina 9-17-11

New Sample Numbers & Wells

~~G-9 = SCA-GW01/GW01F~~ GW

VW37 = SCA-GW02/GW02F

VW25 = SCA-GW04/GW02F

VW16 = SCA-GW03/GW02F

Wells H-1, G-1, and GM-22 are eliminated.

All other numbers remain the same

RAD Samples from GM-18, GM-14, VW25, VW37, ~~GM-13~~ (HC), and GM-13D

Carol V. 9/17/11

Weather high 70s going to mid 80s chance of thunderstorms in PM.

Team members Michele Lotz & Joe Schmidl (Weston).

Health & Safety Keep hydrated, buddy system and pH of water.

Scope Low flow sample groundwater wells and collect samples.

0700 Arrived at office and started to pack supplies and equipment for groundwater sampling. Sample location table revised with additional wells.

0720 Health and safety meeting.

0730 YSI is calibrated according to manufacturers specs.

0750 Packed bottle sets for sampling.

0820 set up at G-9. Depth to water is 100.23ft. No pid reading due to open well with no cap.

0850 Set up bladder pump and all associated hoses and tubing.

Michele Lotz 9/19/11

0935 Started pump and waiting for water to travel up tubing.

1005 Continued pumping to get water out of well.

1035 Water is in flow through cell.

1040 Started recording readings.

1045 SCA-TB01 collected and preserved down to <2 pH.

1115 Continued sampling.

1145 Continued sampling.

1215 Continued sampling.

1245 Pump shut off. Sampling complete at G-9. Sample labelled SCA-GW02 and SCA-GW02F for filtered.

1300 Dropped off samples to office.

1330 Set up at G-11. Depth to water is 35.62ft.

1334 Started pumping well.

1406 Started sampling. SCA-GW04/GW04F collected.

1430 Lunch.

1500 Set up at VW-25. Depth to water is 35.35ft.

Michele Lotz 9/19/11

St. Croix Alumina groundwater

9/19/11

1515 Started pump at VW-25.

1551 Started sampling SCA-GW07/GW07.

1620 Completed sampling and packed up.

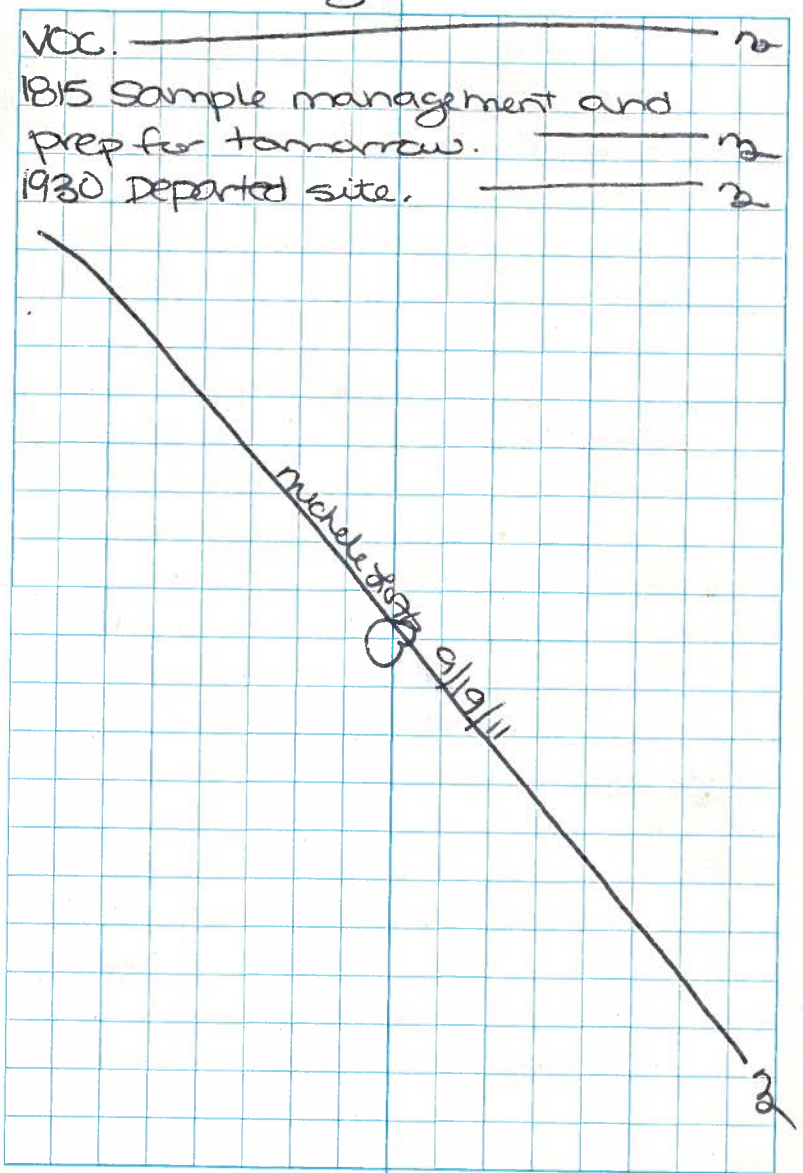
~~***~~ NOTE ~~***~~

All locations are sampled with new disposable tubing for water and air lines to bladder pump. New bladders are placed in pump after decon between sample locations.

1655 Set up at VW-16. Depth to water is 29.68ft bgs.

1705 Started pumping well at low flow <500mL/min.

~~1710~~ 1737 Started sampling, VW-16, SCA-GW03/GW03F.



1757 Completed sampling. Packed up and mobilized back to office.

1800 Collected/created SCA-TB02, 2nd trip blank for PM and tomorrow samples for VOC.

Michele Zertz 9/19/11

1815 Sample management and prep for tomorrow.

1930 Departed site.

Michele Zertz 9/19/11

"Outdoor writing products...
...for outdoor writing people."

RECYCLABLE

"Rite in the Rain" - A unique All-Weather Writing paper created to shed water and enhance the written image. It is widely used throughout the world for recording critical field data in all kinds of weather.

Available in a variety of standard and custom printed case-bound field books, loose leaf, spiral and stapled notebooks, multi-copy sets and copier paper.

For best results, use a pencil or an all-weather pen.

PAGE	REFERENCE	DATE
2-19	SW/SED SAMPLING	9/12-15/2011

St. Croix Alumina SW/sed sampling 9/12/11

0700 Weston arrives onsite and sets up to start sampling in the mangrove area of the site for surface water and sediment. ——— MZ

0730 Health and safety meeting led by A. Byrum. Sampling logistics meeting led by G. Gilliard and E. Knydit. —MZ

Team members: Michele Lortz and Joe Schmidl (Weston). —MZ

Health & safety: slips, trips, and falls, proper PPE and keep hydrated. ——— MZ

Weather: lows 80s, cloudy, slight breeze, on and off showers, humid. ——— MZ

0937 Weston mobilized through internal gate by lower cooling pond and notified main gate. ——— MZ

0950 Weston observed that one sample jar size was missing and mobilized back to office. ——— MZ

Michele Lortz 9/12/11

0954 Weston went through internal gate again. ——— MZ

1012 Weston went through internal gate. -MZ

1040 Set pot MAN-SW09 / MAN-SED09. pH for water is 7.79. MZ ——— MZ

1045 Surface water sample collected

1047 Sediment sample MAN-SED09 collected and GPSed. ——— MZ

1100 Mobilized to MAN-SW/SED10 —MZ

1115 pH is 7.79 with 1 inch of water on mudflat area, Location GPSed. —MZ

1120 Surface water MAN-SW10 collected.

1125 Sediment MAN-SED10 collected. —MZ

1140 Mobilized to MAN-SW/SED11. —MZ

1143 pH of surface water is 8.30. Location GPSed. ——— MZ

1145 Surface water MAN-SW11 collected. -MZ

1147 Sediment sample MAN-SD11 collected

1210 Lunch. ——— MZ

1320 Mobilized back out to mangrove sediment/surface water. ——— MZ

1333 Called main gate and drove through gate by lower cooling pond

Michele Lortz 9/12/11

St. Croix Alumina surface water/ sediment sampling 9/12/11

1410 ~~0210~~ Arrived at MAN-SW12. pH of water was 10.25. Location GPSed.
1412 Surface water MAN-SW12 collected
1415 Sediment MAN-SD12 collected.
1425 Arrived at MAN-SW/SD-16. pH of water is 9.70. Location GPSed
1430 Surface water MAN-SW16 collected. water is directly west of the effluent of the mangrove swamp. *Photo 1 & 3*. Brown turbid scum floating on top of water. *Photo 2*.
1435 Sediment MAN-SD16 collected.
1500 Tried to calibrate pH meter and standard 7 is reading 10. No pH to be taken in field.
1525 Arrived at ~~SW~~ MAN-SW/SD13. Location GPSed.
1530 Surface water MAN-SW13 collected.
1533 Sediment MAN-SD13 collected.
1545 Torrential rainshower so break in car until it lessens.
1600 Mobilized to MAN-SW/SD08

michele Zorz 9/12/11

9/12/11 St. Croix Alumina sediment/ surface water sampling

1615 ~~1615~~ to surface water MAN-SW08 collected.
1620 Sediment MAN-SD08 collected.
1635 Mobilized to MAN-SW/SD14 & 15.
1700 surface water MAN-SW15 collected
1705 Sediment MAN-SD15 collected
1710 Mobilized to MAN-SW/14/SD14.
1715 Surface water MAN-SW14 collected.
1720 Sediment MAN-SD14 collected.
1740 Mobilized back to office.
1753 Called guard shack to notify them traveling through gate.
1806 Downloaded GPS coordinates
1845 pH readings on ~~sediment~~ surface water samples. MAN-SW08 = pH - 8.06
MAN-SW12 = pH 8.13.
MAN-SW13 = pH 8.52.
MAN-SW14 = pH 8.67.
MAN-SW15 = pH 9.06.
MAN-SW16 = pH 8.05.
1900 sample management.
1930 Team departs site.

michele Zorz 9/12/11

Team members Michele Lortz, Joe Schmidl, Anthony Daniels (Weston)

Weather mid 80s, chance of rain showers

Health & Safety Chance of weather storms, safety vest & hard hat near landfill.

Scope Continue to sample surface water/sediment. Plan to collect ACC and BG samples.

0700 Arrive at office and continue to prepare sample bottles sets

0720 Headed to offsite background locations to recon accessibility

0840 Returned to office and packed car for sampling.

0920 Health and safety meeting.

0930 Mobilized to ACC-SW/SD01

0950 Headed through lower cooling pond gate.

0950 Set up at ACC-SW01/SD01 MS/MSD. pH is 9.31. Location GPSed.

0952 Surface water ACC-SW01 collected

0957 Sediment sample ACC-SD01 collected.

1010 Set up at ACC-SW/SD04. GPSed location. pH is 8.05.

Michele Lortz 9/13/11

1012 Surface water ACC-SW04 collected.

1020 Sediment ACC-SD04 collected.

1080 Arrived at ACC-SW/SD-02/03 location. to walk through mangroves to edge

1045 After a couple attempts, deemed unable to get through from roadway.

1100 Navigate to ACC-SW05.

1105 pH is 7.55. Location GPSed.

1107 Surface water ACC-SW05 collected

1110 Sediment ACC-SD05 collected.

1130 Arrived at ACC-SW06. pH is 8.05. Location GPSed.

1135 Surface water ACC-SW06.

1140 Sediment ACC-SD06 collected.

1145 Arrived at ACC-SW07. pH is 8.44 Location GPSed.

1147 Surface water ACC-SW07 collected

1150 Sediment ACC-SD07 collected.

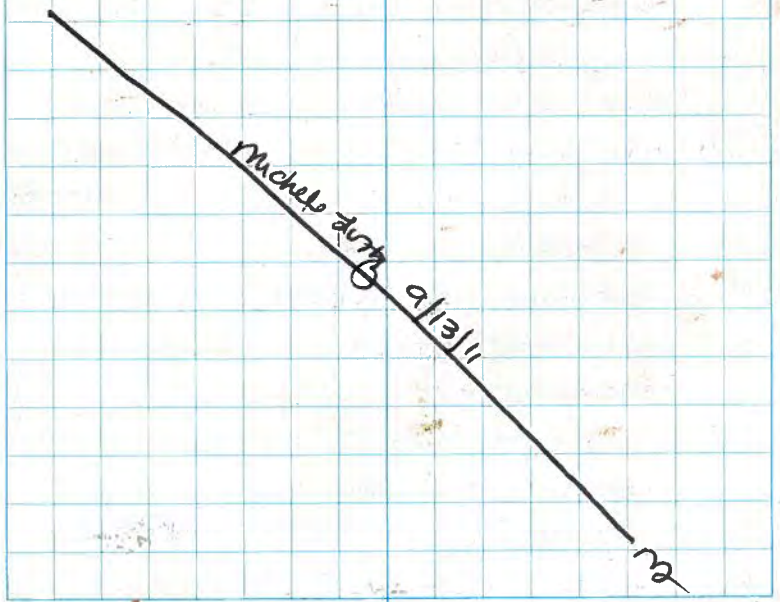
1205 Drove through garage gate to ACC-SW52.

1210 Set up at ACC-SW52. pH is 8.08. Location GPSed.

1212 Surface water ACC-SW52 collected.

1215 Sediment ACC-SD52 collected.

Michele Lortz 9/13/11



St. Croix Alumina sediment/surface water sampling 9/13/11

1217 Drove through garage gate and called Maingate. Locked behind. —mb
1221 Sprayed off car at garage. —mb
1245 Lunch. —mb
1345 Mobilized offsite to landfill to collect BG samples. —mb
1410 Set up at BG-SW54. Location GPSed. —mb
1412 Surface water BG-SW54 collected.
1415 sediment BG-SD54 collected. —mb
1420 Navigated and set up at BG-SW53.
1422 Surface water BG-SW53 collected. Location GPSed. —mb
1425 Sediment BG-SD53 collected. —mb
1440 Set up at BG-SW55. —mb
1447 Surface water BG-SW55 collected. Location GPSed. —mb
1453 Sediment BG-SD55 collected. —mb
1513 Set up at BG-SW56. Location GPSed
1515 Surface water BG-SW56 collected.
1518 Sediment BG-SD56 collected. —mb
1530 Returned back to office and helped with sample management. —mb
1635 sediment samples measured out

Michele Lentz 9/13/11

9/13/11 St. Croix Alumina sediment/surface water

and mixed with DI water to sit for 1hr before pH is measured. pH measured from water samples BG-SW53 = 6.98, BG-SW54 = 7.54 BG-SW55 = 7.89, BG-SW56 = 7.54. —mb
1645 Surface water metals preserved to pH less than 2. —mb
1730 completed sediment pH readings —mb
1749 Labelled samples and completed sample management. —mb
1830 Departed site. —mb

Michele Lentz 9/13/11

St. Croix Alumina sediment/surface water sampling 9/14/11

Weather mid 80s, sunny, chance of storms.

Team Members Michele Lortz, Anthony Daniels (Weston).

Health & safety work safely and dont trek anywhere not safe, take breaks, hydrate.

0700 Arrived at office and prepped bottle for sampling. Team logistics - 2 sediment teams for morning.

0800 Health and safety meeting.

0830 EPA is screening background locations for RAD detections. When they finish they will be ready to RAD screen our locations.

NOTE All sediment logged on separate log sheets.

0900 GPS data file transfered to EPA.

0945 Set up at LCP-SW/SD27. Location GPSed. pH is 8.50 at 37.4°C. No RAD readings to move our locations. 2088 cpm detected on RAD meter.

0957 surface water LCP-SW27 collected.

1000 sediment LCP-SD27 collected.

Michele Lortz 9/14/11

1012 Setup at LCP-SW26. RAD meter screened area. pH is 8.18 at 30.8°C. 1300 cpm RAD at sample point.

1019 Surface water LCP-SW26 collected.

1021 Sediment LCP-SD26 collected.

1030 Set up at LCP-SW28. RAD meter screened area, pH is 8.10 at 29.8°C 1218 cpm RAD at sample point.

1035 surface water LCP-SW28 collected.

1037 sediment LCP-SD28 collected.

1050 setup at LCP-SW29. RAD meter screened area. pH is 8.75, temp at 35.0°C. 2174 cpm RAD at sample point.

1051. Surface water LCP-SW29 collected

1054 Sediment LCP-SD29 collected

1100 His break.

1130 Starting moving from Waste Area B to lower cooling pond through outfall. Location LCP-SW/SD30 moved to outfall. RAD detection at outfall is 2883 cpm. pH is 10.16 at 36.0°C. Location GPSed.

1133 Surface water LCP-SW30 collected.

1136 Sediment LCP-SD30 collected.

1155 Set up at ADP-SW49.

Michele Lortz 9/14/11

St. Croix Alumina sediment / water 9/14/11

1203 7090 cpm at the water location ADP-SW49. pH is 9.65 at 30.6°C Location GPSed. 11296 cpm on edge of ash disposal pond where sediment collected. —3

1205 Surface water ADP-SW49 collected —

1207 Sediment ADP-SD49 collected. —3

1215 set up at ADP-SW48. RAD meter screening being done. 2320 cpms detected. pH is 9.61 at 31°C.

1218 Surface water ADP-SW48 collected

1220 Sediment ADP-SD48 collected. —

1245 set up at ADP-SW50. RAD meter screening being done. 4337 cpm detected. pH is 9.61 at 32.6°C.

1248 surface water ADP-SW50 collected.

1251 Sediment ADP-SD50 collected. —

1308 Set up at ADP-SW51. pH is 9.57 at 37.9°C. RAD screening done in area. 3539 cpm at proposed beach area. —3

1310 Location shifted due to RAD screening levels of 4150 cpm. Location GPSed

Michele Zertz 9/14/11

9/14/11 St Croix Alumina sediment / surface water samplings

pH is 9.57 at 36.1°C. —10

1318 Surface water ADP-SW51 collected

1320 Sediment ADP-SD51 collected. —3

1325 Highest sediment RAD at ADP-SD49 so RAD sample to be collected there.

1330 RAD sample at ADP-SD49. RAD levels 12698 cpm. —3

1331. Reading on sample ~6000 cpm. —3

1333 14220 cpm on red area on side of ash disposal pond. sample collected.

1340 red mud ADP-SD49 RAD collected. —

1350 Washed down car at garage. —10

1400 Lunch. —2

1500 meeting to discuss afternoon logistics and sample bottle set prep. RAD information given to EPA. —10

1550 mobilized to UCP-SW/SD39. —3

1615 Inaccessible from where we parked.

1645 set up to sample RMS locations —

1715 Set up at PM UCP-SW39. pH is 8.18 at 31.8°C. RAD meter is 31099 cpm —3

1720 Surface water UCP-SW39 —10

1725 Sediment UCP-SD39 collected. —4

1735 mobilized back. →

Michele Zertz 9/14/11

St. Croix Alumina sediment/ surface water samplings 9/14/11

1735 set up at UCP-SW40. RAD meter is 29934 cpm. pH is 8.27 and 30.3°C. Location GPSed. —
1740 Surface water UCP-SW40. — m
1745 Sediment UCP-SD40 collected. —
1800 Set up at UCP-SW41. RAD meter is 24955 cpm. Location GPSed. pH is 9.88 at 31°C. — m
1805 Surface water UCP-SW41. —
1810 Sediment UCP-SD41. — m
1815 moved RMS-SW45 north 75ft. RAD meter screened 32415 cpm Location GPSed. pH is 9.85 at 30.1°C. — m
1817 Surface water RMS-SW45 and RAD water sample collected. —
1820 Sediment RMS-SD45 and RAD sediment collected. — m
1840 Returned to office. — m
1900 Unpacked samples. Washed red mud from car. Provided EPA with RAD data. — m
1945 Departed site. — m

9/14/11
Michele Lertz

Weather low 80s, sunny → going to high 80s, chance of showers. — m
Team members Michele Lertz & Anthony Daniels (Weston). — m
Health & Safety Use sunblock, keep hydrated. — m
0700 Arrived at office and prepared sample sets for continued sediment sample collection. — m
0815 Headed out RMS-SW46. — m
0820 Set up at RMS-SW46. pH is 9.53 at 27.37°C. Location GPSed.
0825 Surface water RMS-SW46. — m
0828 Sediment RMS-SD46 collected. —
0850 Moved RMS-SW47 upward the mudflow from waste pile.
Photo taken of mud flow area. — m
0855 Sediment RMS-SD47 collected No water sample due to no water present. Location GPSed. — m
0900 Set up at RMS-SD42/43 which was moved to the outflow closest to the access road near the mud pile. Photo taken

Michele Lertz 9/15/11

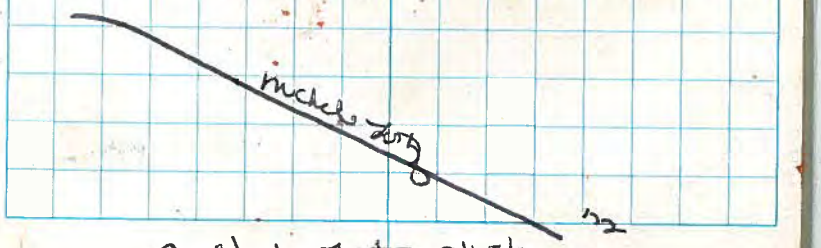
St. Croix Alumina sediment/ surface sampling 9/15/11

0901 surface water RMS-SW42 collected
0902 surface water dup RMS-SW43. —mz
0907 sediment RMS-SD42 collected. —
0908 sediment RMS-SD43 collected. —
pH is 10.10 at 29.35°C. —
0915 Returned to office and unloaded samples. —
0930 Washed cars before leaving site. —mz
0950 Parked up at landfill and started walk to MAN-SW19. —
1010 Set up at MAN-SW19. Location GPSed. pH is 7.90 at 29.5°C
1012 surface water MAN-SW19. —
1016 Sediment MAN-SD19 collected. —
1030 Returned to site. —mz
1045 EPA wanted to access different sample methods on soil waste pile so Weston unpacked samples and waited. —mz
1130 Logistics meeting to discuss plan for remainder of day. —
1145 mobilized to try to find a location for ACC-SW02/03. —mz

Michele Lentz 9/15/11

1154 Weston & EPA traveled through lower cooling pond gate. —mz
1225 Unable to get closer to ACC-SW02/03 from beach area.
1226 Headed through gate by lower cooling pond to try to traverse outflows to channel. —mz
1240 Location looks inaccessible and need to reconveen about location. —mz
1305 Lunch. —mz
1400 mobilized to MAN-SW18. —
1412 mobilized through west ditch gate. —mz
1420 set up to navigate to MAN-SW18
1430 Man observed spear fishing in ocean near MAN-SW18. —mz
1445 EPA trying to find where red mud flows into ocean to try to move MAN-SW18. —mz
1446 Spoke with man who was checking on fish pots out in ocean. Robelos, lives in Prophet community up hill. Fishes with nets (3 nets stated out) Looking for snapper and has caught

Michele Lentz 9/15/11



9/15/11 St. Croix Alumina sediment surface water sampling

Snapper up to 17-18 inches. —
No phone number for the fisherman. —
Fish collected for consumption
1500 Set up at MAN-~~SW18~~ SW18-INV. Location GPSed. pH is 8.65 at 35.0°C. —
1503 Surface water MAN-SW18. —
1506 Sediment MAN-SW18 collected. —
1515 EPA decided MAN-SW18 was not representative of anything we wanted to sample. No visual observation of red mud impact so location scrapped. ——»
1535 Weston/EPA motored through west ditch gate. ——»
1600 Set up at UCP-SW36. Location GPSed. pH is 8.65 at 35.6°C. —»
1602 Surface water sample collected. —
1605 Sediment UCP-SD36 collected. —»
1650 Set up at WES-SW25. No water at this location. Spoke to EPA and they are ok with not collecting a water sample. —
1657 Sediment WES-SD25 collected. —
1915 Headed towards UPC-38 & UCP-39

Michele Zurtz 9/15/11

9/15/11 St. Croix Sediment/surface water sampling

1930 Set up at UCP-SW38. ——»
1732 pH is 8.40 at 30.87°C.
Location GPSed. ——»
1734 Surface water UCP-SW38 collected
1736 Sediment UCP-SD38 collected. —
1745 RAD surface water and sediment to be collected at A UCP-SW39, —»
1750 Surface water RAD sample collected at UCP-SW39. ——»
1752 Sediment RAD sample collected at UCP-SD39. ——»
1800 EPA requested that we collect a RAD sample from UCP-SW39 due to the high levels of RAD detected yesterday. ——»
1815 Samples dropped off at office
1845 GPS file downloaded. ——»
1850 Assisted with sample management.
1930 Departed site. ——»

Wetlands Survey.

12:55 Weston Solutions Wetlands Scientists Joseph Schmidl and Michele Lortz began survey of extent of wetlands along the downstream pathway from the St. Croix Alumina site. We began our survey along the western edge of the Renaissance Group Property, along the access road.

13:15 We arrive at the southern end of the access road, near the junction of the lacustrine wetlands mapped to the east of the road and the estuarine wetlands mapped to the east. Our observations confirm the presence of vegetated mangrove swamps (white mangrove and button mangrove, with minor red mangrove) on both sides of the roadway.

13:30 We continue southeastward along the causeway, confirming continuous mangrove swamp along both sides of the causeway, except for the upland area mapped on the NWI map. Our survey confirms the accuracy of the NWI map.

9 September 2011 St. Croix Alumina

13:40 We have reached the southeastern corner. The beach is a scarp face, with a caliche layer that is about 18 inches thick, that erodes away to expose a sandy layer beneath. We make two advances to the beach in this area, finding white mangroves and button mangroves, the dominant species, and both wetland indicators. In addition, we observe a few plant beds just beyond the surf zone, which also constitute wetlands.

14:00 We proceed northerly on the access road and pass through the internal gate on the road east to the southern (lower) settling pond. We can now observe the mangrove swamps that are located in the settling pond to the west, and the channel to the east (estuarine swamp). These are beautiful examples of dense red mangrove swamps along the estuary side, and white mangroves predominate on the settling (55) pond side. Both swamps are

9 SEPTEMBER 2011 St. Croix Alumina

continuous along both water bodies, and red mangroves are even present in the small gap in the estuarine wetlands located on the NWI map. There also appear to be lacustrine swamp wetlands surrounding the edge of the small pond located east of the Red Mud Disposal Areas. We take a series of photos which document the vegetation along the access roads and the beach.

14:30 We return to the office.

11 SEPTEMBER 2011 St. Croix Alumina Site

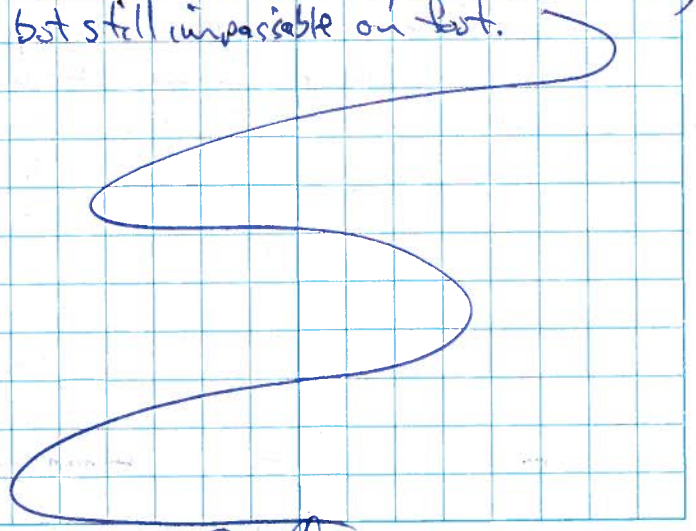
Following further reconnaissance, these further observations have been made.

The estuarine wetland located south of the Lower cooling pond is a classic barrier island complex, with a beach, dune area, marsh lagoon, and a flat, low lying shoreline on the landward side, as depicted below.

It is clear that the access road was constructed across the natural lagoon, which would have originally included the lower Cooling Pond. The Beach area is sandy, with reefs immediately offshore, which include marine plant beds.

The Dune area is dominated by portia tree (Thespesia populnea) which is Facultative, as well as salt the Marsh area is dominated by algal mats and Black Mangroves (Avicennia germinans) characterized by expanses of pneumatophores. with some White Mangroves (Laguncularia racemosa) all of which are hydrophytes.

11 SEPTEMBER 2011 St. Croix Alumina Site



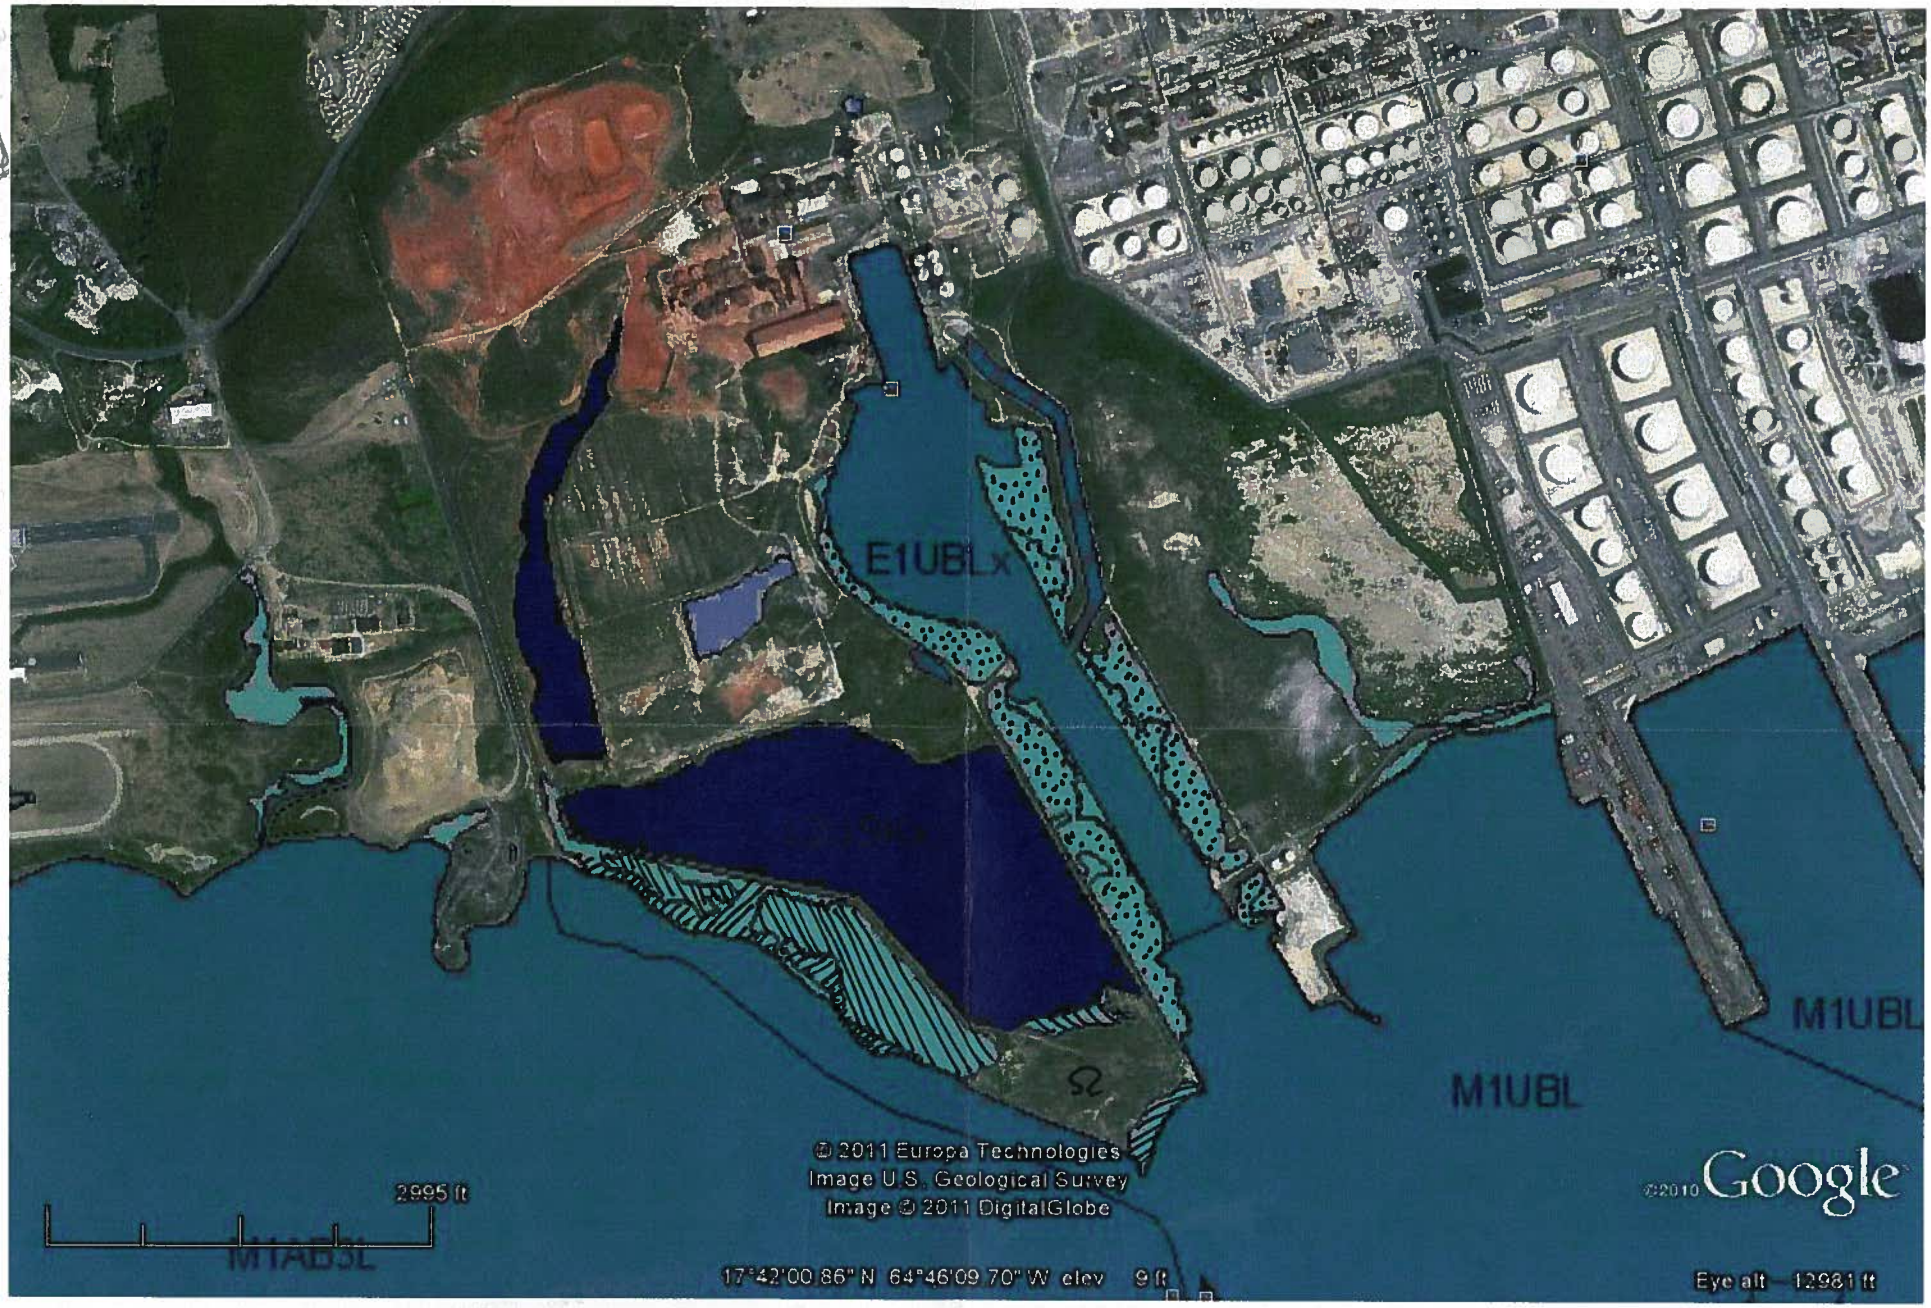
Where the access road crosses the lagoon area, Black Mangroves and White mangroves are growing along the berm for the road. In the Lower Cooling Pond, the bottom of the pond below the mangrove fringe is covered with algal mats, and is very shallow, typically less than 6 inches deep for as far as can be observed from the edge. Regarding the sides of the inlet used for shipping traffic, the water is much deeper (presumably dredged to maintain shipping access), and the fringing area is a wide mangrove swamp. The water in this area is deeper (between 6 inches and 2ft) and generally inaccessible by foot - we have to climb amongst the mangroves to access this area.

The Upper Cooling Pond also has fringing black mangrove swamps, but these fringes are relatively thin (10 to 30 ft wide), as the banks are steeper and higher resulting in upland habitat. There is also common salt wort in these areas, particularly in the southern portion of the Upper

Jill

11 SEPTEMBER 2011 St. Croix Alumina Site

Cooling Pond. There are no algal mats. The West Ditch also has fringing black and white mangrove swamp, and like the Upper Cooling Pond, the banks are steep and the bordering wetlands are therefore narrow (10-20 ft). The West Ditch is of unknown depth, but appears to be steep-banked, and may be up to 6 ft deep. There is no apparent emergent vegetation in the active West Ditch. In the former West Ditch, the black mangroves extend further into the ditch, which is shallower, but still impassable on foot.



Jill

16 September 2011 ST. CROIX AUDUBON SITE

We have now reconsidered the background surface water west of the west ditch, known as the Gut. The topography of this area is higher than that to the east, resulting in a deeply incised natural meandering channel, and one oxbow pond, clearly visible on the aerial photograph. The Oxbow pond and the gut are estuarine wetlands, comprising dense red mangrove swamps. The beach area between the Gut and the oxbow pond is dominated by portia tree and saltwort, with a few white mangroves. The fringing wetlands are relatively narrow in this area as well.

0800 DEPART COMMAND POST FOR THE ~~MUD~~ RED MUD PILE

0813 ARRIVE ON RED MUD PILE, SET-UP STAGING AREA/ COMMAND POST.

0845 NAVIGATE RMA-WST-02 R

0910 Collected Rad sample and metals sample @ RMA-WST-02, Normal 43886 cpm. Red mud waste surface sample. prep the down hole samples. Severe difficulty obtaining down hole sample tube into and out of the bore hole. A. Byrum takes logbook.

1030 - moved to RMA-WST-03 to collect surface sample, red mud, on a slope on north side, dry, homogeneous 47740 cpm, Collected surface samples for Rad and Metals analysis.

1055 - Moved to RMA-WST-04 to collect surface sample (A) - red mud, N of surface water body, homogeneous. 43445 cpm, collected Rad & Metals sample.

2/15/11 St. Croix Alumina

1120 - moved to RMA-WST-12 (offset) to collect surface sample, adjacent to surface water pond @ top of the pile, silty with moisture on location.

LATE ENTRY - 1135 - RMA-WST-02B Collected from tube - 2-4' depth for metals & RAD. - No Rad screening done on down hole sample, which was collected using geoprobe coring.

1145 - walked back to staging area.

1200 - Leave RMA area for lunch

1250 - Back on-site, gathering supplies for PM sampling @ RMA area.

1320 - Drive back to staging area, prep for PM sampling effort.

1410 - Begin work on RMA for subsurface sampling @ RMA-WST-03B, 04B & 12B.

1430 - Collected RMA-WST-03B - from 4.5' depth on reverse side next to surface pile (to E).

1451 - Collected RMA-WST-04B - from 4' depth on reverse wall S of surface pile.

1455 Move to RMA-WST-12 RMA to collect sample.

1500 - 67065 cpm - Hole @ WST-12B,

9/15/11 St. Croix Alumina

1500 cont - Collected RMA-WST-12B, RAD, Organics + Metals. Also collected organics RMA-WST-12A sample, and RAD Water sample from pond in the RMA area.

1522 - Collected RMA-WST-05 A+B @ off-set location. CPM: 49801 surface RAD + Inorganics. - Down hole - 86329 cpm. - 3-4' depth for B.

1545 - Collected RMA-WST-06 A+B @ flag location - 3-4' depth for B. Surface = 44014 cpm

Downhole = 57470 cpm Crevasse area

1600 - @ RMA-WST-13-A+B

Downhole - crevasse - 69385 - cpm

Surface = 45169 cpm

1610 - Collected RMA-WST-13 A+B

1635 - Collected RMA-WST-20 A+B

Surface = 42856 cpm

Downhole crevasse = 44621 cpm

1655 - Moved to RMA-WST-18 A+B

63549 cpm - in crevasse

4980 cpm - surface

1700 - Collected samples @ RMA-WST-18 A+B from surface & in crevasse next (S).

9/15/11 St. Croix Alumina

1700 cont. - Samples collected and logged By SAM-940 - 60 uR/hr on surface

1730 - Sampled water on top of RMA area - for Radiation, directly E of RMA-WST-12 sample site. using 5 gallon cubitainer.

1733 - Walk back to staging area, doff PPE, collect samples to take down to sample mgmt, Auger bucket for Rinsate sampling, and supplies/IDW to store @ training building

1745 - Leave staging area, arrival @ training building.

1800 DECON EQUIPMENT FOR RINSATE SAMPLE

1825 COLLECT RINSATE SAMPLE. WST-RIN01 SVOCs, PCBs, METALS, RAD.

1930 DEPART THE SITE. END OF LOG DAY.

9/15/11

Weather Mid 80s, sunny, hot, humid, chance of storms.

Team members M. Lartz, A. Daniels, D. Cobb, A. Byrum, & E. Krydt (Weston)

Health & safety Keep hydrated, buddy system, slips, trips, & falls.

0700 Weston arrives on site and starts prepping for continued red mud soil sampling on Red Mud Area A.

0800 EPA arrives onsite.

0805 Health and safety meeting.

0830 Arrive at decon tent on RMA and don PPE.

0850 mobilized to RMA-WST19A|B.

0851. EPA starts RAD monitoring.

0852 44934 cpm at surface location RMA-WST19A.

0855 RMA-WST-19A collected. Locations GPSed.

0856 46973 cpm in crevice location.

0857 started hand augering in crevice to collect RMA-WST19B.

0900 Crevice location is 5ft below ground surface. RMA-WST19B collected.

Michele Lartz 9/16/11

0901 EPA runs separate scan. 51.7 micro R per hour dose and thorium 232 detected.

0908 set up at RMA-WST09. RAD screening conducted.

0910 41708 cpm at RAD surface.

0915 RMA-WST09A surface and RMA-WST09B in crevice collected.

0916 Crevice RAD is 77719 cpm at a depth of 7ft.

0917 SAM monitoring on crevice sample. Count of 3 mins. Thorium 232 at 49.5 uR per hour dose.

0930 set up at RMA-WST08. Location GPSed. 41267 cpm at surface location.

0935. Sample RMA-WST08A collected and subsurface RMA-WST08B collected.

0936 RAD subsurface is 57091 cpm. subsurface depth is 4.5ft.

0945 set up at RMA-WST07. Location GPSed.

0950 426085 cpm at surface location. RMA-WST07A collected at surface. RMA-WST07B subsurface collected.

Michele Lartz 9/16/11

951 67639cpm on subsurface soil. —
952 SPM being done on surface soil. Subsurface depth collected at 8ft. 49.8μR per hour dose for Thorium 232. —
1000 Walk back to cars for health and safety break. —
1035 Set up at RMA-WST01. Location GPSed. —
1037. 28773cpm at surface location
1040 surface RMA-WST01A collected and subsurface RMA-WST01B coleded. —
1045 Duplicate on subsurface RMA-WST01C collected. —
1046 RAD reading down subsurface auger hole is 68139 cpm. SPM screening at surface is Thorium 232 at 38.2μR per hour. Depth is 4ft for subsurface location. —
1055 Set up at ~~WST~~ RMA-WST10. Location GPSed. —
1100 Surface sample RMA-WST10A collected. 40531 cpm RAD at surface. Subsurface 6525 cpm RAD at subsurface. RMA-WST10B

Michele Zintz 9/16/11

collected. —
1105 Subsurface depth is 5-6ft. —
1106 SPM on subsurface soil is Thorium 232 at 46.8μR per hour. —
1115 Set up at RMA-WST11. Location GPSed. 47359 cpm at surface RAD.
1120 Surface RMA-WST11A collected and subsurface RMA-WST11B collected. —
1125 Duplicate RMA-WST11C collected at surface. —
1126. 86584cpm on subsurface location. —
1127 Depth of 8ft on subsurface soil. —
1135 Packed up all material from pile and mobilized samples back to office. —
1200 Lunch. —
1315 Logistics meeting to discuss plan for afternoon work and accessibility of locations. —
1320 EPA requested a half hour to get resorted before we head out. —
1350 Mobilized back to RMA. —
1357 Set up at RMA-WST17. 37365 cpm at surface location.

0705 BEGIN PREPARING EQUIPMENT, SUPPLIES, AND PPE FOR SAMPLING ACTIVITIES.

0735 DEPART COMMAND POST FOR RED MUD PILE B

0740 ARRIVE AT RED MUD PILE B.

0750 @ RMB-WST-39, A. Byram takes log. Surface Count = 32846 cpm. AB

Subsurface = 83671 cpm AB

0800 - Collected RMB-~~WW~~ST-39 A & B next to stream cut / flow path away. B sample collected @ approx 3' depth. ~~to~~ 8'

~~0810~~ 0810 - Collected samples @ ~~10~~ depth RMB-WST-37 A & B. - B @ 8' depth.

Surface count - 29275 cpm AB

subsurface count - 73027 cpm AB

0835 - Collected RMB-WST-~~39~~ A+B - 38 B @ 0 depth. - Not Collected

Surface counts = 39246 cpm. AB

B sample Not collected because water is at ~~Approx~~ 4-6" depth in the hole AB

~~0910~~ 0910 Collected RMB-WST-36 A+~~B~~ NO B sample

Surface - 41554 cpm Collected due to Augur refusal

B sample collected @ 0 depth - Augur refusal

9/19/11 St. Croix Alumina

0929 - Auger refusal @ 24" depth due to caliche rock. Three additional locations near the original 36 point were investigated and all had caliche rock close to surface.

0935 - Collected RMB-WST-34 A+B
surface counts = 31243 cpm NO SAM
subsurface = 73376 cpm reading - low
B sample collected @ 3.5-4' depth.

0940 - completed samples, walked back to staging area where Belinda are.

1010 - moved to ADP area, to collect points 41 and 42

1015 - collected ADP-WST-41 A+B + C (sub dup)
counts - surface = 6942 cpm
subsurface = 7001 cpm hole
B/C samples collected @ 4' Bgs depth, due to hole collapsing into perched water.

1035 - collected ADP-WST-42 A+B Added MS/MSD for Inorganics on surface
Surface = 6136 cpm
Subsurface = 10847 cpm
B sample collected @ 4' depth BGS.

LATE ENTRY - Duplicate @ ADP-WST-41-C called @ 1020 hours for sample mgmt.

All samples collected in ADP area.

9/19/11 St. Croix Alumina

1045 - Complete ADP-WST sampling
move back to command post
to repack and drop off samples from prep and packaging for shipping.

1115 - Driving back to RMB area from the command post.

1135 - Collected samples @
RMB-WST-29 A+B.
Surface = 29432 cpm
Subsurface = 89340 cpm
B sample collected @ 3.5' depth

1200 - Collected RMB-WST-40 A+B -
Surface = 21510 cpm NO B sample collected
Subsurface = Not collected
B sample collected @ ___ depth BGS
NO B sample collected because of caliche in the hole @ 24" depth

1210 - Moved to RMB-WST-30 A+B
31344 Surface CPM Collected @
84596 subsurface cpm 1210 hrs
B sample collected @ 4.0' depth BGS.
due to groundwater intrusion.

1230 - Moved / collected RMB-WST-28 A+B
Surface counts = 38522 cpm
Subsurface counts = 72418 cpm

9/19/11 St. Croix Alumina

1230 Cont. - Collected B sample @ 4' depth BGS due to water intrusion in the hole.

1235 - Completed RMB-WST-28 A+B, moved to RMB-WST-32 A+B.

1245 - Collected RMB-WST-32 A+B - west to UCP - on berm - NO B sample Surface - 15927 cpm Augen had caliche rock in it @ 8-12" depth.

1300 - Walked back to vehicles, loaded equipment, drove back to command post.

SAMPLES COLLECTED TO THIS TIME:
RMB-WST-32A, 28A, 28B, 30A, 30B, 40A, 29A, 29B, 34A, 34B, 36A, 38A, 37A, 37B, 39A, 39B, 40A. ADP-WST-41A, 41B, 42A, 42B. Also added RMC source area

1430 - Collected RINO3 sample from RMB augen bucket after decon.

1510 - Move back to RMB area to collect rest of RMB samples (N area)

1520 - Collected RMB-WST-22 A+B
Surface = 36338 cpm
Subsurface = 72763 cpm
B depth = 10' ft BGS, @ base of caliche spoil hill, SE of settling pond.
No ~~Incorporate~~ organic bottle collected.

9/19/11 St. Croix Alumina

1520 cont. - Collected GPS of Red Mud area B open area using trimble, Area is approx 14,864 ft² (according to GPS)

1522 - Collected RMB-WST-22B @ 10' BGS

1540 - ~~Collected RMB-WST-22C (Foundation)~~ 23

The Red mud @ 22 is sandy, different material than previously sampled. NO Dup collected @ 22, due to low recovery of sandier materials.

1555 - Collected RMB-WST-23 A+B.
B sample collected @ 7.5' ft BGS
36864 = Surface CPM
12338 = Subsurface CPM
Collected area on trimble around 23.
subsurface sample has same consistency as coffee grounds.

1610 - Did not complete sampling @ 23B due to rain and lightning

1650 - Rain slowed, continued to augen to depth for B sample. Combined B sample - 7.5' depth due to partial recovery with previous recovery bucket. Area is approx 3210 ft².

1700 - Collected RMB-WST-23 B+C duplicate @ depth - 1710 hrs.

9/19/11 St. Croix Alumina

1715 - Arrived @ RMB-WST-21
13204 cpm @ RMB-WST-21
NO SAMPLE Collected. Auger refusal @ 2-3" depth, too much cobble in surface.

1740 - Arrive @ RMB area RMB-WST-24 between Area B and settling pond. collected RMB-WST-24A - NO B Sample due to water in the sample @ 2" depth. Sample was collected in the area between RMB and the settling pond.

LATE ENTRY - ~~Duplicate Sample @ RMB-WST-23 was not sent for analysis not needed~~. Sample @ RMB-WST-40 was full Scan, with Organic and Inorganics.

1800 - Move back to command post to package samples and clean equipment, prep for next day.

1900 - Continuing Sample preps and packing.

1930 - Left site for hotel for end of day.

AB to

9/19/11

to A

9/20/11 St. Croix Alumina

0620 - Lease hotel for site in rental jeep

0650 - Arrive @ main gate, acquire badges

0700 - Packing jeep for daily activities. heavy rain with some thunder and lightning are in the area expected to continue all day (Flash flood watch).

0800 - Due to rain and rescheduling, collection of FBS samples has been moved up, begin preps for FBS sampling. No RAD in surface, collect RAD readings using Auger to drill into the piles to collect subsurface samples w/ RAD.

0910 - Drive to FBS area (under Large shed)

0920 - Prepare to collect FBS samples.

0925 - Collected FBS-WST-44 A+B
Surface = 20292 cpm NO B Sample
Subsurface = 30639 cpm Collected.
B sample collected approx 8" depth in the pile. Red mud was mixed with Bauxite/Alumina and was not sampled per EPA Rosoff.
Collected RAD Sample from surface.

0935 - Collected FBS-WST-45 A (NO B) surface - 30329 cpm

No B sample due to Bauxite/Alumina in 14" depth of the pile in the sample area.

9/20/11 St. Croix Alumina

0950 - Collected ~~RMA~~ FBS-WST-46A NO BS sample collected due to other materials (bauxite/Alumina) in the subsurface (depth of approx 8-12") below the pile surface.

Surface reading = 18142 cpm

0955 - Arrive back to command post to drop off samples and data and to package samples for shipping.

LATE ENTRY - Red Mud in the FBS Area appears to be heavily mixed with bauxite, alumina and misc debris. Some sample sites had alumina 6-12" depth below red mud samples. multiple auger holes were advanced around each sample location, with results being similar across the various points.

AB

9/20/11

0655 - Arrive on site @ command post. prepare for sampling activities.

0730 - pack jeep for sampling of BKGnd sediments, red mud area A and also the FBS-WST-43 sample @ large shed

0800 - Drove off site to BG-16 site

0810 - Collected BG-S16 location samples.

Surface = 3531 cpm

Subsurface = 6318 cpm

near the ~~old~~ wastewater treatment plant near the landfill.

Background subsurface @ = 3.5' BGS. Stopped due to auger refusal.

~~0815~~ Collected BG-SS16 (subsurface).

0825 - Drove back to Red mud area A to collect the two additional RAD samples

0850 - On RMA - to collect RMA-WST-R01 + R02.

0900 - Collected RMA-WST-R01

52745 cpm = Surface

RAD Surface only, in flat area.

0915 - Collected RMA-WST-R02

55799 cpm = surface

RAD surface only.

0925 - walk to staging area, breakdown of tent.

9/21/11

0950 - Drove to FBS area & collect 43.
1000 - Collected FBS-WST-43A ONLY
NO B sample due to caliche @
6-8" depth.
Surface = 16338 cpm.
1025 - Collected RMA-SD-57
surface sediment sample
Surface = 29713 cpm
depth is approx 14" until refusal,
though there is caliche in the
floor bed. No subsurface collected.
1038 - Collected RMA-SD-58
surface sediment sample
Surface = 22327 cpm
depth of red mud is approx. 24-28"
1055 - RMA-SD-54 Collected
surface sample only for sediment
Surface = 20539 cpm
Red mud @ approx 24-30" depth
on stream wall and bed.
1105 - RMA-SD-60 Collected
surface sediment only
Surface = 23416
Red mud @ approx 16-18" depth due to caliche.

9/21/11

1115 - RMA-SD-61 collected
Surface sediment only, heavily
vegetated area on opposite side of
berm from floodplain.
Surface = 12798 cpm
1127 - RMA-SD-62 & 63 collected (Time on
63 is 1130. Collected surface sample only.
with a dup for RAD + Inorganics.
Red mud in floodplain @ approx 24" depth
until a different soil type (Brown sandy
silt) was encountered.
1140 - walk back to the vehicles, decon
and drive back to the command post.
1145 - Drop off samples and assist
w/ data and sample mgmt.
1320 - prep for ADP area measurement
and also depth testing for volumes.
1340 - Drive to ADP area, measuring
RST-2 Trimble - approx 35,742 ft 2
and hand augers for depths -
Six additional auger holes advanced
to refusal @ approx 4.5' depth.
2 holes down to 5' depth to refusal
on intact rock/soil on western most hole.

Ph: (732) 585-4400

9/8/11

The following Weston Solutions personnel mobilized to the St Croix Alumina Site (SCA site) with supplies and equipment:

- Gerry Gilliland - Region V, START III Project leader
- Dan Carlson - Sample Mgmt / SCRIBE
- Derrick Cobb - Soil / Red Mud Sampling
- Anthony Daniels - " " " "
- Alex Byrum - Site Safety Officer
- Michele Lortz - GW/SW/SED Sampling
- Joe Schmidl - GW/SW/SED and Wetland delineation w/ Michele Lortz. [Joe arrived on 9/9/11 due to weather related flight delays] EM 9/11/11

Property owner, St. Croix Renaissance Group (SCRG) has provided their training facility as our command area to be shared with EPA. Facilities include A/C, wireless internet, Mens/Womens restrooms, refrigerator, electric and room for equipment storage, sample management. SCRG also provided a garage and vehicle wash-down

9/8/11

St. Croix Aluminum Site.

The facility has 24-hr security. All visitors must sign in, receive a vehicle pass card and a visitor badge. Possession of a TWIC card or continual escort by a TWIC card-holder is required to be on-site. 9/8/11

9-9-11

0740 - Weston arrives at facility to continue with equipment and supplies mobilization.

0800 - Melissa Jackson, SCRG HR person, conducted the facility orientation and health and safety meeting. Ms Jackson provided site contact information and described procedures for moving + working on the site. Two logbooks and an SCRG 2-way radio were provided for recording entry, exit, and locking of access gates on the site.

0830 Orientation completed. Weston

St. Croix Aluminum Site

9/9/11

0930 Weston members G. Gilliland, J. Schmidl and M. Lortz are escorted by SCRG Alternate Field Safety Officer Alphonsus Dennis to Three (3) interior gates on the site that Weston field sampling teams will need to enter and exit to complete field sampling tasks. The following procedures must be followed regarding the access gates:

1. Radio into the security guard the time you enter and the time you exit a gate.
2. Record the date + time of each entry/exit through a gate and the personnel involved in the log-book provided by SCRG.

1030 J. Schmidl and M. Lortz prepare to conduct the wetland survey along the southern, coastal area of the site and along the shipping/docking channel.

1200 J. Schmidl and M. Lortz depart for wetland survey; J. Schmidl given

1330 D. Carlson + G. Gilliland leave site to purchase field supplies and have lunch. Rest of team taking inventory of equipment received and tracking equipment with FedEx for items/supplies yet to be received.

1400 Received a call from Ildefenso Acosta, EPA, indicating that All EPA personnel ~~did not~~ delayed their flights to St. Croix due to Tropical Storm (TS) Maria. All EPA personnel to arrive on Monday 9/12/11; Mike Ferriola to arrive first around 2:30pm; remainder of team to arrive about 9:30pm. M. Ferriola asked that Weston assist him in transporting EPA equipment from the UPS facility at the ~~site~~ (EK) airport to the SERG facility on Monday afternoon.

1430 Based on a conversation between G. Gilliland (Weston) and OSC's M. Ferriola / D. Rosoff: It is ok to begin SW/SED sampling in

1500 Weston continues to mobilize and organize equipment, supplies and organize work area to be shared with EPA. Continue to track down and resolve "fees" issue with some field supplies "hung up" at UPS facility at the airport. Other field equipment arrived and stored at hotel.

1800 Ael Weston personnel off-site EK MK MT 9/9/11

9/10/11

0800 Weston personnel arrive at the site, (EK, GG, DC AD, ML, JS, DC, AB). Weather - Hot, humid, brief showers; TS Maria expected later today.

0830 A. Byrum conducts brief safety meeting. Mobilize additional equipment and supplies that arrived via FedEx to the hotel last night.

Re-arranged Command Post to follow a

9/10/11

0845 D. Carlson continues to work on and set up SCRIBE database.

0900 G. Gilliland notifies Zak (SRG) primary contact (FSO), that Weston plans to measure pH of red-mud/soil, and water on the site and measure Depth to Water (DTW) and Total Depth (TD) of wells to be sampled. Zak ok with planned activities.

0930 A. Daniels + J. Schmidl proceed to get test samples of red-mud and water for pH testing.

M. Lortz and D. Cobb steam cleaning water level and oil-water interface probe, then go to locate remainder of wells to be sampled, measure DTW and TD of wells.

1000 J. Schmidl and A. Daniels return to test pH of soils, red-mud.

1030 J.S. and A.D. also test pH of puddle/accumulated water at base of Red Mud pile in Area A. with pH paper, red-mud = 10-11

1100 pH of red mud from pile in Area A = 10.1, pH of soil w/ red-mud across access road from pile in Area A = 8.64

1115 Determine nitric acid requirements to preserve red-mud water: 60-ml of 1:1 Nitric Acid reduces pH from 10.19 to 1.5 for 1-Liter of red-mud water.

1130 M. Lortz + D. Cobb go to local hardware store to purchase additional field supplies, on return they continue to well recon (recording data in a seperate logbook).

1145 A. Byrum drives Route to Hospital

1320 A. Daniels + J. Schmidl continue to test pH of red-mud/water. M. Lortz and D. Cobb continue with well recon. Remainder of field staff working on sample Mgmt, SCRIBE, and Safety Details.

1430 pH readings of red-mud ~~and~~ water of other sampling locations on Site (meter-tested)

- Red mud settling pond = 9.71
- Upper Cooling Pond, south end = 8.22
- Lower Cooling Pond, NW corner = 8.17

9/10/11

St. Croix Alumina Site

9/10/11

1500 A. Daniels, D. Carson, J. Schmidl off site for weekend. E. Knyfl and G. Gilliland off-site for lunch.

1530 E. Knyfl and G. Gilliland return to site.

1600 Notes about GW well observations; additional details in GW logbook.

- GM-22: Buried under limestone rubble.
- G-1: Damaged, no inner casing, silted up with only 1-foot of water
- H-1: 6" of measured floating product.
- G-7: Could not locate; try again on Monday.
- GM-13D: Red-mud washout area.

1600 A. Byram, M. Lortz, D. Cobb off site.

1700 E2K., G. Gilliland off-site.

9/10/11

St. Croix Alumina Site

9/12/11

0715 Weston personnel arrive on site, including E. Knyfl, G. Gilliland, A. Byram, D. Cobb, M. Lortz, A. Daniels, D. Carlson, J. Schmidl

A. Byram, Site Safety Officer, holds Safety Meeting, discuss heat stress, loose-unstable footing, hydration, discuss route to hospital, about 0.5 mile north of Sunny Isle Shopping Center. Discuss sample bottle/equipment requirements, etc.

0810 Safety briefing completed. Help field teams organize their sampling equipment for background sample collection and for SW/SED sample collection in the mangroves.

0850 A. Daniels + D. Cobb leave to begin collection of background samples.

0908 M. Lortz + J. Schmidl leave to begin surface water sediment sample collection in the mangroves.

0910 A. Daniels and D. Cobb return to command post to load GPS'd sample locations onto the RST2 Trimble.

0930 A. Daniels + D. Cobb head back out to collect background soil samples.

St. Croix Alumina Site

9/12/11

1100 - A. Daniels + D. Cobb return to command post; raining, so they will take lunch now.

1155 - Mix of sun/clouds/rain and thunder. Thunderstorm approaching site from SW.

315 Measure pH of background soil samples:

- BG-SD2-00: pH = 7.42 @ 24.1°C
- BG-SD1 ~~2~~: pH = 7.80 @ 24.2°C (EK)
- BG-SD2-16: pH = ~~8.07 @ 23.1°C~~ → 7.72 @ 24.1°C (EK)

1330 A. Daniels + D. Cobb head back out to collect background soil samples.
M. Lortz and J. Schmidl head out to continue with surface water / sediment sampling.

1410 A. Daniels / D. Cobb return to command post. They indicate that 0-6" comprises soil and >6" depth they encountered bedrock at a consistent basis.

1430 hr M. Lortz and J. Schmidl return to field to collect surface water and sediment samples.

1435 E. Knypl works on finalizing the

St. Croix Alumina Site

9/12/11

1610 D. Carlson + E. Knypl drive to FedEx with one cooler of soil + water samples to be delivered and analyzed by USEPA Region 2 DESA. pH of all shipped samples was measured ~~via EPA Method~~ (EK) and found to be between 7.02 - 7.80; therefore samples do not meet corrosive nature for Dangerous Goods (DG) shipping via air transport.

1700 hrs (EK) D. Carlson + E. Knypl return from FedEx.

1800 M. Lortz and J. Schmidl return from their surface water and sediment sample collection.

1925 Field team test pH of all collected samples, preserves those that need preservation and wrap up work for the day.

1930 hr A.D., A.B., D.C., J.S., M.L., D.Cobb leave the site.

1945 E. Knypl + G. Gilliland leave the site.

9/12/11

0700 - Weston personnel on Site: D. Carlson, G Gilliland, A. Daniels, M. Lortz, E. Knafla, D. Cobb, A. Byrum and J. Schmidl.
Weather - Cloudy/overcast/humid/ Temp ≈ 80° F.
*Note: At hotel, Weston received 3 boxes of Macro Core sleeves (66x3) and 1 box of MacroCore Soil Catchers.

0745 G. Gilliland, M. Lortz, J. Schmidl drive to locate access and sample locations for sw/sed sampling today.

1030 EPA personnel arrive on Site, Ilde + Nidal first, then Dave Rosoff Chris D'Onofrio, and Mike Ferrola. Mallorie + Alphonsus (SCRG) at the Training Center, to give them orientation to EPA personnel.

1040 Speak with Paul Callahan (Weston RSO for Region 1 EPA) about DG Dec forms for Corrosive liquids. Per Paul, print cans are not needed. Remember

1225 EPA personnel preparing their radiation equipment for rad screening on the red mud pile in Area A.

1235 Receive a call from Cindy White at NAREL; she will call me back with an answer about the 3 lb weight limit per shipment/treatment stated in their soil permit.

1255 EPA personnel having lunch, SW/SED sampling team (A. Daniels, J. Schmidl, M. Lortz) come back with samples. D. Carlson getting lunch for Weston staff.

1315 EK, G. Gilliland, D. Carlson, A. Daniels, M. Lortz have lunch.

1345 EK, GG, D Carlson, AD, ML off lunch.

1420 EK calibrates the Orion Model 730A pH meter. to Buffers of 7.00 and 10.00.

1425 Begin measuring pH of sediment samples ACC-SD01, ACC-SD04, ACC-SD05, ACC-SD06, ACC-SD07, and ACC-SD52.

1447 finish pH measurements; all pH's range

9/13/11

1455 Prepare labels for outside of outer packages for Corrosive Solids UN 3262 and Corrosive Liquids, UN 3266, if needed.

1530 Drive out to Red Mud pile
30-50 counts - Surface area
60-88 counts - gullies

1720 Mud pile Scoping meeting.
- Use Proposed Sample locations
- 3' Wood Stakes or Rebar
- Set up 100' x 100' area around stake → Sample @ highest location
- Then Model to Scan whole pile stake out hot spots that are ID'd but not collected.

* Various discussions regarding how to proceed.

1830 hr EPA personnel off site
Weston personnel AD, ML, JS, AB, D Cobb off site.

1840 hr EC Knuffke, G. Gilliland, D. Carlson off site.

9/13/11

0705 EC K on site; M. Lortz, D. Carlson, A. Byram, D. Cobb, G. Gilliland, A. Daniels, J. Schmidt.

0745 D. Cobb goes to hardware Store to pick up Wood survey stakes / rebar / paint and/or flagging to mark ~~Stop~~ (EK) proposed sampling locations on the red mud pile.

0830 Plan is for E Knuffke & D. Cobb to navigate to proposed sample locations on red-mud pile A and stake locations for Rad-Screening team.

0900 Gather field gear (PPE) and drive out to red mud pile to meet D. Cobb and help locate proposed sample locations on pile with blue Survey flags.

0925 Navigate to ~~first~~ (EK) waste pile Sample Location RMA-WST-09 → all other information is maintained in D. Cobbs Field book.

1000hr Receive a call from Cindy White at NAREL RE: 3-lb weight limit per shipment in accordance with Next soil permit. → (1) since our sample material

St Croix Alumina Site

(16) 9/14/11

1005 (2) As a precaution we should include the soil permit with our shipping paper as customs may still want to inspect the shipment

(3) The 3-lb weight limit is per Sample, Not per shipment; not a problem for us because a sample container will not exceed the 3-lb. limit.

1115 Navigate to half of the locations on the red mud pile Area A, return to command post for lunch.

1320 On Red Mud pile after lunch break.

1545 Return from mud pile.

1600 Assist with shaking off of sediment samples and packing of sediment samples for delivery to the lab tomorrow.

1723 Finish with sample management tasks for the time being.

1910 Help with sample input of more SW/SED samples that came in at 1830 hrs. Gather Geoprobe and sampling equipment for tomorrow's red mud

St Croix Alumina (17) 9/15/11

1030 Arrive late on Site; flat tire on vehicle.

RMA-WST-02B

Depth = 3.75'

1135 Collect Red mud sample RMA-WST-02B from 2-4' for Metals Rad parameters.

1200 Crew comes off the red mud pile for lunch.

1225 At training center. break for lunch.

1315 Back at training center.

1420 At red mud pile.

1430 AA RMA-WST-03 to collect sample of red mud at depth.

1451 Collect RMA-WST-04B @ 4 ft.

1500 Collect RMA-WST-12B @ 3-4 ft. for Rad, Metals, PCBs, SVOCs.

1522 At RMA-WST-05 A & B

1615 AA RMA-WST-13 to collect Samples from surface "A" and from depth "B". RMA-WST-13B @ 8' base of Crevasse.

1645 Collect RMA-WST-20B @ 4' for Rad parameters. @ base of crevasse.

9/16/11

0710 Arrive at site. All of Weston personnel on site.

0755 Mike Ferrola and Nidal Azzam here for EPA, Dave R, Chris D. and I. Acosta notin (meeting w/DPNR this morning).

0830 Arrive at redmud pile. M. Lentz, D. Cobb, A. Daniels, A. Byrum, E. Kryfl for Weston and M. Ferrola + N. Azzam

0845 At RMA-WST-19A+19B. 46973 in crevasse (cpm) 44934 cpm surface "B" location, 5' bgs in crevasse.

0900 Sample RMA-WST-19B

0910 At RMA-WST-09 location. Mike F. reads 50 uR/hr 41708 cpm in surface location "A" at RMA-WST-09A At RMA-WST-09B, crevasse,

0913 777.19 cpm. Mike F. gAM reading of "B" location at RMA-WST-09B Th-232 49.5 uR/hr

9/16/11

0935 At location RMA-WST-08 41267 cpm at surface location. Radial Screening at RMA-WST-08B A. Daniels & D. Cobb → 57091 cpm at "B" location. Depth = 4.5' bgs

0945 At RMA-WST-07 A+B Surface reading = 42685 cpm "A" Subsurface reading = 67639 cpm "B"

1000 Begin liquid refreshment break

1035 End break. At location RMA-WST-01.

1040 Collect RMA-WST-01B

1045 Collect RMA-WST-01C (dup)

1055 At RMA-WST-10

1100 RMA-WST-10A collected 40531 cpm at surface

1105 RMA-WST-10B collected 64252 cpm at subsurface, crevasse.

1117 At RMA-WST-11B 86584 cpm in crevasse for depth Sample

1120 Collect RMA-WST-11B at

(20)

9/16/11

1175 Collect duplicate RMA-WST11C at surface.

1176 86584 c/m on subsurface location

1135 Pack up equipment from field + mob back to command for lunch.

1200 Lunch

1315 Logistics meeting to discuss afternoon work

1320 EPA requests half hour to get recorded before continuing field work.

1300 Mob to RMA. Sampling details documented in logbook of S&S member M. Lortz

9/16/11

(21)

9/16/11

Page Intentionally left blank

9/16/11

Page intentionally left blank.

9/16/11

0745 Arrive on site

0830 Mob w/ A. Byram, D. Rasoff, C. Donofrio. To complete Rad Screening Only.

0853 Headset to ADP (ER)

Flag ADP-WST-42

0917 Flag ADP-WST-41

Alex Byram GPS'ing locations. We asked that we estimate the area of the ADP, the black surface soil visible on map at locations 41 + 42

0935 Navigate to location in Area B not previously looked at.

0940 Log RMB-WST-29

0950 Walking down along the pond in Area B. Find some red mud.

0955 Reading only 3229 cpm - not high enough to be of concern.

1007 Log and flag RMB-WST-32 just east of UEP.

1025 Locate and log RMB-WST-28.

1030 Locate and log RMB-WST-30.

1040 Walk through the eastern and western 1/4 of the north half

9/17/11 St. Croix Alumina

1725 Looking for well GM-02 in area just west of Caliche pile west of Bauxite storage Bldg.

1234 Locate and flag the following RMB-WST-22 RMB-WST-23

1300 hr - Break for lunch

1400 hr - Back from lunch

1407 Late Entry - Locate and log RMB-WST-40 for full scan analyses. EK

Late Entry (2): Locate and log RMB-WST-21

1500 GBA leaves the site

1600 Weston leaves the site

Late Entry - J. Schmidt taping up first red-marked Non D.G. shipment for the NAREL Lab; to be shipped by FedEx on Monday, 9/19/11. 9/17/11

9/19/11

0650 Arrive at facility - E. Krayer, G. Gilliland, D. Gobb, A. Daniels, M. Lortz, D. Carlson, J. Schmidt, A. Byram.

0720 Work with D. Rosoff / C. D'Onofrio on former Bauxite Stg Area: samples FBS-WST-43 A/B, FBS-WST-44A/B, FBS-WST-45 A/B, and FBS-WST-46 A/B. EK

Weather: Sunny, some clouds, 80°F.

0755 G. Gilliland, D. Rosoff, C. D'Onofrio to sample former Bauxite Stg Area.

0800 - Help D. Carlson pack up sample coolers for FedEx shipment; DG & Non-DG samples.

0900 Receive 30 bags of ice from Hennemann Ice Co.

2400 hr Working with Dean Carlson to re-preserve sample coolers with fresh ice for delivery to FedEx today. Prepare DG Declaration forms for sample shipments to Chemtech Consulting Group + USEPA Region 2 DESA Lab → SAT samples.

1320 D. Rosoff, N. Attaam, M. Ferrola, return to training building. 9/19/11

1305 Break for lunch (EK)

1415 off lunch. Continue to weigh out red mud for pH analyses/testing.

1530 Finish weighing soil for red mud pH analyses and ~~finish~~ Begin labeling sample containers with red mud collected today.

1700 Finish labeling sample containers of red mud collected today from Area RM "B" and from the Ash Disposal Ponds.

1715 Begin reading pH of red mud samples:

1823 The follow red mud samples test positive for DG (pH > 11):

- RMB-WST28B
- RMB-WST29B
- RMB-WST34B
- RMB-WST37A
- RMB-WST37B

1825 Find sample ADP-WST42B and prepare for pH testing.

1915 Complete preparing last few

2000 Finish preparing last red mud samples collected for the day for pH testing. All samples picked up and labeled

Notes:

- 20 red mud waste samples from area A shipped to NAREL, COC # 2-091711-140743-0023, Fed Ex Airbill # 874731024731, Sample were not "DG" samples.

9/19/11

0715 Arrive at Facility.

0730 Call Cindy White of NAROZ Lab and inform her that our first shipment of 20 red mud waste samples (RMA) should arrive at lab today, including the following:

RMA-WST01A
- 02A
- 03A (COC #
- 04A 2-091711-140743-0023
- 06A FedEx #
- 07A 8747 3102 4731
- 09A
- 09B
- 11A
- 12A
- 14A
- 14B
- 15A
- 16A
- 16B
- 17A
- 17B

0740 Rain, thunder, lightning delaying the start of work.

0745 As of 07:45 AM, samples on previous page are in Birmingham, AL at FedEx's sorting facility.

0800 E. Knytl calibrates the Orion model 230A pH meter to reference pH buffer solutions of 7.00 and 10.00.

0805 Meter returned an auto-calibration error; → retry auto calibration, using fresh 7.00 & 10.00 buffer solutions.

0848 Identify the following additional "D6" red mud samples:

RMB-WST22A
- WST22B
- WST23A
- WST23B
- WST23C

} Collected late 9/19/11

0900 A. Byram, D. Cobb, A. Daniels to accompany N. Azzam & M. Ferriola for former Bauxite Storage Area sample collection.

1035 finish determining pH of red mud samples listed above at time of 0848; only (EP) pH of all these samples are

9/20/11

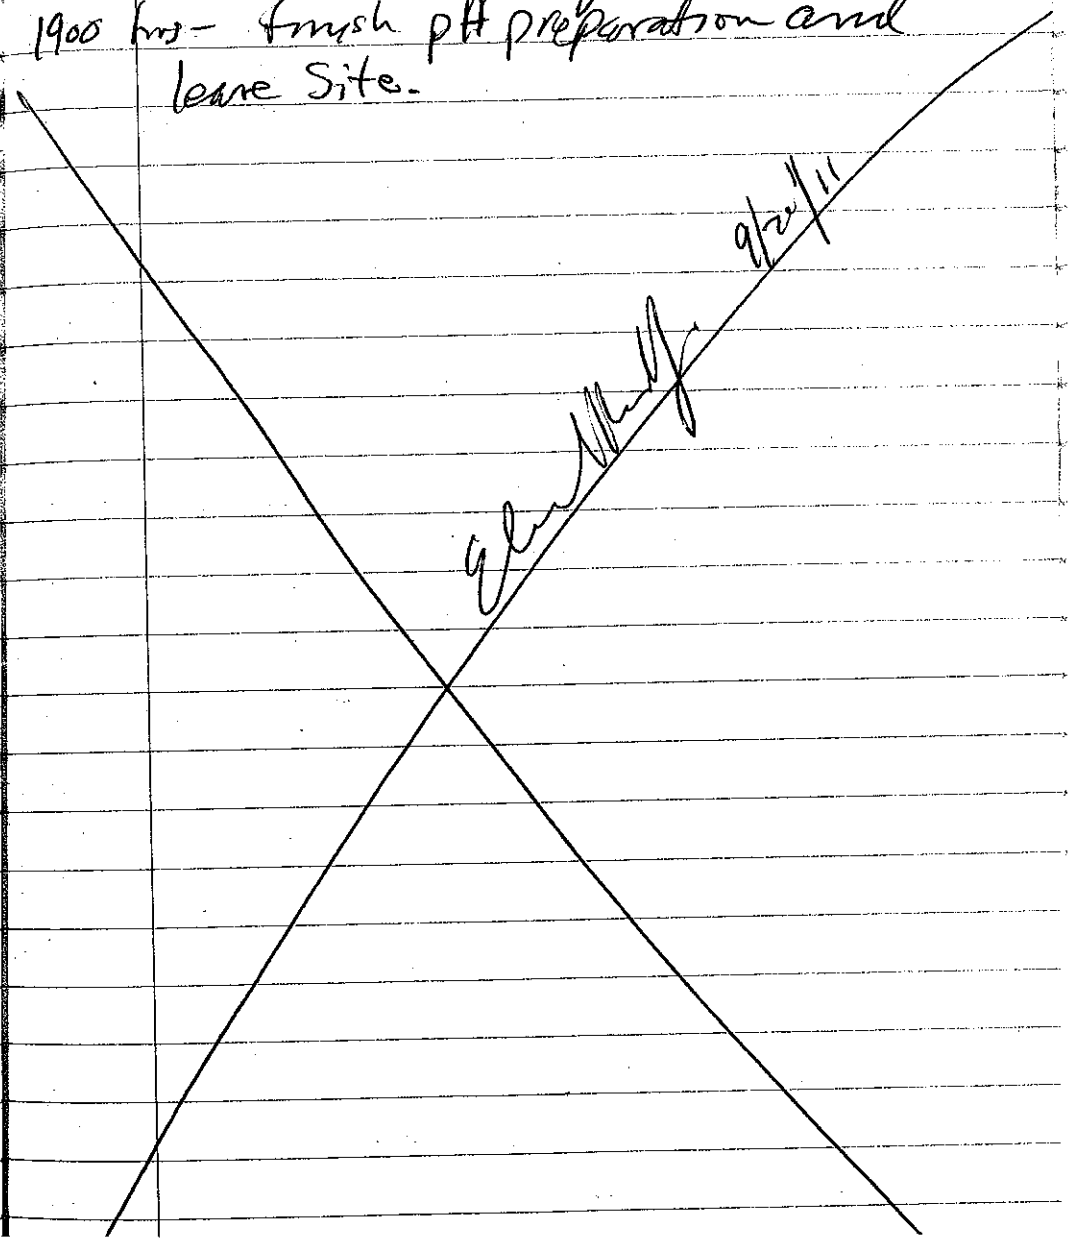
1040 Account for TAL Inorganics that are not DG to go to DESA Lab.

1200 E. Knyfe breaks for lunch

1300 E. Knyfe off lunch

1310 E. Knyfe checking red mud shipments to the lab (NAREL).

1345 Screen the coolers being shipped to NAREL, and DESA with a Ludlum Model 19 uR meter. Background reads 3-5 uR/hr; each cooler reads 4-6 uR/hr. Readings are well below the 250 uR/hr action level to qualify for DG for radiation.



1500 Drive to US Customs at airport to resolve release - issue of 2 packages of calibration gases for the Multi-Rae.

1615 Organize remainder of DG red mud samples and prepare them for preservation on ice (TAL Metals).

1700 Drive FedEx paperwork, DG forms and Commercial Invoices to D. Carlson at FedEx. Return with DG

1745 Return to Site, assist with determining pH of background samples collected late today.

1900 hrs - finish pH preparation and leave Site.

0700 Arrive on Site.
0720 Begin measuring pH of background samples collected late yesterday.
0830 Finish testing pH of background soil samples BG-SØ9, S1Ø, SØ7, S15, S14, S13, SØ8, S11, and S12 → all are not DG for shipping.
0848 Prepare another cooler for red-mud Rad shipping to NAREL, DG and non-DG.
0855 Assign Sample ID's ~~RMA-WSTØ2A~~, ~~RMA-WSTØ1~~ (EL) RMA-WSTRØ1A, RMA-WSTRØ1B, RMA-WSTRØ2A and RMA-WSTRØ2B for two additional red mud samples collected in Area A based on Gamma Screening exposure survey.
0947 Finish packing 1 cooler with DG Rad samples for NAREL; including RMA-WSTØ2B/Ø1C/Ø3B/1ØB/ and 12B → 2 containers each.
0950 Start a 2nd DG Rad red mud cooler for NAREL containing so

1000 Both DG coolers with red mud going to NAREL are properly labeled with Class 8 labels, "Y" (limited qty. label) and label with UN#, Technical Name, and Net. Qty identified.
1005 Begin prepwork for Non-DG Rad cooler to go to NAREL; including UCP-SD35, UCP-SD37, UCP-SD39, RMS-SD45, BG-S01, LCP-SD33, RMA-WST 20B, RMA-WST 13A and 13B, and ADP-SD49.
1030 Prepare samples BG-S1ØA, RMA-WSTRØ1A and RMA-WSTRØ2A for pH testing.
1120 Finish prep for pH testing of samples started at 1030 hrs.
(EL) 1255 Prepare sediment and Former Bauxite storage Area samples for pH testing. Read pH of BG-S1ØA, RMA-WSTRØ1A and RMA-WSTRØ2A; all come back as non-DG (< 11 pH).
1300 Pack up a non-DG Rad cooler of red mud samples for shipment to NAREL.
1325 Drive to FedEx and drop off DG Rad shipment for delivery to NAREL.

St. Croix Alumina

9/21/11

1420 Continue with packing of sample coolers for rad analyses; red-mud, soil/red mud mixture and water for rad analyses.

1700 Preserve all the water samples in Cubitainers to a pH of 2 with 1:1 HNO_3.

1745 Help J. Schmidl put together DG DEC form for shipping DG liquids, corrosive to lab for analyses (SAT parameters).

920 Finished 75% of the packing of field equipment to return to to Edison, NJ (RST2).

930 E. Knytl leaves the Site.

9/21/11

St. Croix Alumina

9/22/11

0700 E. Knytl & J. Schmidl arrive on Site.

0715 Weather, Sunny, 80° F, some clouds. Continue with preparation of samples to be shipped out to the labs via Fed Ex, and shipment of field equipment back to RST2 in Edison, NJ.

9/22/11

FedEx Express — International Air Waybill

For FedEx services worldwide.

DELIVERED 9/16/11

✓ Sender's Copy

1 From *Please print and press hard.*

Date 09/14/11 Sender's FedEx Account Number 108 067 691 SENDER'S FEDEX ACCOUNT NUMBER ONLY

Sender's Name Dan Carlson Phone 973-271-7633

Company Weston Solutions, Inc.

Address Tamarind Reef Hotel

Address 5001 Tamarind Reef

City Christiansted State Province VI

Country USA ZIP Postal Code 00820

2 To

Recipient's Name John Birri Phone 732-906-6886

Company USEPA Region 2

Address 2890 Woodbridge Ave. Dept./Floor

Address Building 209 MS-230

City Edison State Province NJ

Country USA ZIP Postal Code 08837

Recipient's Tax ID Number for Customs Purposes
e.g., GST/RFC/VAT/IN/EIN/ABN, or as locally required.

3 Shipment Information

For EU only: Tick here if goods are not in free circulation and provide C.I.

Total Packages (Shipper's Load and Count/SLAC) 1 Total Weight 53 ☐ lbs. ☐ kg DIM L / W / H ☐ in. ☐ cm

Commodity Description	Harmonized Code	Country of Manufacture	Value for Customs
Environmental Samples (soil + water) for LAB TESTING ONLY			

Has EEI been filed in AES? For U.S. Export Only: Check One
☐ No EEI required, value $2,500 or less per Sch. B Number, no license required (NLR), not subject to ITAR.
☐ No EEI required, enter exemption number:
☐ Yes – Enter AES proof of filing citation:
If other than NLR, enter License Exception:

Total Declared Value for Carriage

Total Value for Customs (Specify Currency) $200.- USD

4 Express Package Service

Packages up to 150 lbs. / 68 kg. For packages over 150 lbs. (68 kg), use the FedEx Expanded Service Intl. Air Waybill.

☒ FedEx Intl. Priority ☐ FedEx Intl. First (Available to select locations.)
☐ ☐ FedEx Intl. Economy (FedEx Envelope and FedEx Pak rate not available.)

5 Packaging *These unique brown boxes with special pricing are provided by FedEx for FedEx Intl. Priority only.

☐ FedEx Envelope ☐ FedEx Pak ☐ FedEx Box ☐ FedEx Tube
☒ Other Cooler ☐ FedEx 10kg Box* ☐ FedEx 25kg Box*

6 Special Handling

☐ HOLD at FedEx Location ☐ SATURDAY Delivery (Available to select locations for FedEx Intl. Priority only.)

7 Payment Complete payment options for both transportation charges and duties and taxes.

Bill transportation charges to: Enter FedEx Acct. No. or Credit Card No. below.

☐ Sender Acct. No. in Section 1 will be billed. ☐ Recipient ☒ Third Party ☐ Credit Card ☐ Cash/Check/Cheque (FedEx Use Only)

FedEx Acct. No. 108 067 691

Credit Card No.

Credit Card Exp. Date

Bill duties and taxes to: Enter FedEx Acct. No. below. ALL shipments may be subject to Customs charges, which FedEx does not estimate prior to clearance.

☐ Sender Acct. No. in Section 1 will be billed. ☐ Recipient ☒ Third Party

FedEx Acct. No. 108 067 691

8 Your Internal Billing Reference First 24 characters will appear on invoice.

9 Required Signature

Use of this Air Waybill constitutes your agreement to the Conditions of Contract on the back of this Air Waybill, and you represent that this shipment does not require a U.S. State Department License or contain dangerous goods. Certain international treaties, including the Warsaw Convention, may apply to this shipment and limit our liability for damage, loss, or delay, as described in the Conditions of Contract. WARNING: These commodities, technology, or software were exported from the United States in accordance with Export Administration Regulations. Diversion contrary to U.S. law prohibited.

Sender's Signature: [signature]

This is not authorization to deliver this shipment without a recipient signature.

Not all services and options are available to all destinations. Dangerous goods cannot be shipped using this Air Waybill.

For Completion Instructions, see back of fifth page.

ft bgs Feet below ground surface.
PVC Polyvinyl chloride.

SAMPLE/CORE LOG

Boring/Well: GM-13 | Project No.: NJ0293.001 | Page: 1 of 1

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/21/95 | Drilling Completed: 6/21/95

Total Depth Drilled: 18 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 5

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Wes Jamison | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: 140 lbs | Hammer Drop: 30 inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
5	7	1.4	2,3,5,10	Silt and clay with little very fine sand and little well rounded gravel size fragments of limestone; cohesive; rollable; sand increases with depth while cohesiveness decreases; brown, moist to saturated. Saturated at approximately 7 ft below land surface.
10	12	1.5	3,4,7,9	Silt with little clay and some fine sand and trace well rounded gravel size limestone fragments; moderately dense; slightly cohesive; slightly rollable; brown; moist.
15	17	1.4	8,8,10,9	Clay and silt with trace gravel size fragments of limestone (predominantly boundstone); dense; slightly cohesive and slightly rollable; friable; chalky white to tan (limestone), gray (clay) and brown (silt); very moist.

SAMPLE/CORE LOG

Boring/Well: GM-13D | Project No.: NJ0293.001 | Page: 1 of 2

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/23/95 | Drilling Completed: 6/23/95

Total Depth Drilled: 90 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 5 feet

Drilling Fluid Used: None | Drilling Method: Hollow stem auger

Drilling Contractor: CHT, St. Croix | Driller: Ken Easton | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: 140 lbs | Hammer Drop: 30 inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
5	7	1.4	2,3,5,10	Silt and clay with little very fine sand; and little well rounded gravel size fragments of limestone; cohesive; rollable; sand increases with depth while cohesiveness decreases; brown, moist to saturated; saturate at approximately 7 ft below land surface.
10	12	1.5	3,4,7,9	Silt with very little clay, some fine to fine sand and trace and trace well rounded limestone; moderately dense; slightly cohesive and slightly rollable; brown; moist.
15	17	1.4	8,8,10,9	Clay and silt with trace gravel size fragments of limestone (predominantly boundstone); dense; slightly cohesive and slightly rollable; friable; chalky white to tan (limestone), gray (clay) and brown (silt); very moist.
25	27	0.5	91, refusal	Weathered limestone (appears to be boundstone), silt to gravel size fragments; chalky white to red-brown in areas very moist pockets.
30	32	1.0	6,26,53,50	Very coarse to gravel size limestone fragments with some silt; light gray to white gray; saturated.

SAMPLE/CORE LOG

Boring/Well: GM-13D Project No.: NJ0293.001 Page: 2 of 2

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
32	76	NA	NA	Description based on drill cuttings from the augers.
76	90	NA	NA	Lagoonal clay and silt; light bluish gray; description based on drill cuttings from augers.

ALCO519617

SAMPLE/CORE LOG

Boring/Well: H-1 | Project No.: NJ0293.001 | Page: 1 of 1

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/22/95 | Drilling Completed: 6/22/95

Total Depth Drilled: 70 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Tri-cone bit

Length and Diameter of Coring Device: NA | Sampling Interval: NA feet

Drilling Fluid Used: Water | Drilling Method: Air Rotary

Drilling Contractor: CHT, St. Croix | Driller: Wes Jamison | Helper: Floyd & Rob

Prepared by: Derek McGregor | Hammer Weight: NA | Hammer Drop: NA

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
0	70	NA	NA	Weathered limestone with zones of clay and silt intermixed with the limestone matrix.*

*Lithology is based on drill cuttings removed from the borehole during drilling.

SAMPLE/CORE LOG

Boring/Well: H-2 Project No.: NJ0293.001 Page: 1 of 1

Site Location: Vialco, St. Croix, USVI Drilling Started: 6/22/95 Drilling Completed: 6/23/95

Total Depth Drilled: 52 feet Hole Diameter: 6 inches Type of Sample/ Coring Device: Tri-cone bit

Length and Diameter of Coring Device: NA Sampling Interval: NA feet

Drilling Fluid Used: Water Drilling Method: Air Rotary

Drilling Contractor: CHT, St. Croix Driller: Wes Jamison Helper: Floyd and Rob

Prepared by: Derek McGregor Hammer Weight: NA Hammer Drop: NA

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
0	52	NA	NA	Fragments of weathered limestone (predominantly boundstone) with zones of clay and silt; chalky white to light gray.*

*Lithology is based on drill cuttings removed from the borehole during drilling.

SAMPLE/CORE LOG

Boring/Well: H-3 | Project No.: NJ0293.001 | Page: 1 of 2

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/22/95 | Drilling Completed: 6/23/95

Total Depth Drilled: 37 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 5 feet

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Wes Jamison | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: NA | Hammer Drop: NA inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
5	7	0.5	3, 6, 7, 0	Very fine sand to gravel size fragments of weathered (predominately boundstone); friable; chalky white to gray; dry.
10	12	1.7	28, 28, 27, 30	Very fine sand to gravel size fragments of weathered (predominately boundstone); friable; chalky white to gray; slightly moist.
15	17	1.6	33, 28, 54, 48	Very fine sand to gravel size fragments of weathered (predominately boundstone); friable; chalky white to gray; slightly moist.
20	22	1.6	17, 26, 15. 15	Very fine sand to gravel size fragments of weathered (predominately boundstone); friable; chalky white to gray; moist.
25	27	2.0	9, 6, 7, 56	Silt to very fine sand; very soft, nonrollable; moist to saturated. Saturated at 25.5 feet below land surface.
30	32	1.7	70, 31, 21, 14	Fine sand to gravel size fragments of limestone (boundstone) with silt and clay; chalky white to light gray; saturated.

SAMPLE/CORE LOG (Continued)

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
35	37	1.0	33, 39, 29, 41	Fine sand to gravel size fragments of limestone (boundstone) with silt and clay; chalky white to light gray; saturated.

SAMPLE/CORE LOG

Boring/Well: B-1A | Project No.: NJ0293.001 | Page: 1 of 2

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/26/95 | Drilling Completed: 6/27/95

Total Depth Drilled: 36 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 2 feet

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Wes Jamison | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: 140 lbs | Hammer Drop: 30 inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
2	4	0.8	15, 9, 15, 17	Limestone fill.
4	6	0	4, 2, 2, 2	Sand fill.
6	8	0	Refusal	Fragments of limestone (bound stone). Encountered empty cast iron pipe 6 feet below land surface.
8	10	1.2	17, 27, 29, 29	Sand and gravel size fragments of weathered limestone (boundstone); chalky white to tan; dry; no odor.
10	12	1.0	12, 9, drop	Sand and gravel size fragments of weathered limestone (boundstone); chalky white to tan; dry; no odor.
15	17	2.0	53, 46, 24, 13	Sand and gravel size fragments of weathered limestone (boundstone); chalky white to tan; dry; no odor.
20	22	0	Refusal	Denser zone of limestone.
25	27	2.0	23, 40, 21, 9	Sand and gravel size fragments of weathered limestone (boundstone); chalky white to tan; moist to saturated; no odor. Saturated at 31 feet below land surface.

SAMPLE/CORE LOG

Boring/Well: B-1A Project No.: NJ0293.001 Page: 2 of 2

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
30	32	0.8	4, 6, 3, 4	Sand and gravel size fragments of weathered limestone (boundstone); chalky white to tan; dry; no odor.
32	34	2.0	5, 7 ,8 4	Sand and gravel size fragments of weathered limestone (boundstone); chalky white to tan; saturated; no odor.

SAMPLE/CORE LOG

Boring/Well: B-2A | Project No.: NJ0293.001 | Page: 1 of 1

Site Location Vialco, St. Croix, USVI | Drilling Started: 6/27/95 | Drilling Completed: 6/27/95

Total Depth Drilled: 30 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 5 feet

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Ken Easton | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: 140 lbs | Hammer Drop: 30 inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
0	1	NA	NA	Weathered limestone fill with silt and clay; yellow-tan (limestone fill), brown (silt), and red (clay); slightly moist; no odor.
5	7	1.5	9, 7, 11, 30	Sand to gravel size fragments of weathered limestone (boundstone); friable; chalky white to tan; dry; no odor.
10	12	2.0	20, 16, 21, 20	Sand to gravel size fragments of weathered limestone (boundstone); friable; chalky white to tan; dry; no odor.
15	17	1.7	46, 56, 36, 31	Sand to gravel size fragments of weathered limestone (boundstone); friable; chalky white to tan; dry; no odor.
20	22	1.2	17, 27 12, 23	Sand and gravel size fragments of weathered limestone (boundstone); friable; chalky white to tan;. moist to very moist no odor.
22	24	1.5	3, 4, 4, 4	Sand and gravel size fragments of weathered limestone (boundstone); friable; chalky white to tan;. very moist to saturated; no odor. Saturated at approximately 24 feet below land surface.

SAMPLE/CORE LOG

Boring/Well: B-3A | Project No.: NJ0293.001 | Page: 1 of 2

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/2795 | Drilling Completed: 6/28/95

Total Depth Drilled: 36 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 5 feet

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Ken Easton | Helper: Ibu's crew

SAMPLE/CORE LOG

Boring/Well: GM-18 | Project No.: NJ0293.001 | Page: 1 of 1

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/20/95 | Drilling Completed: 6/20/95

Total Depth Drilled: 27 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 5 feet

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Wes Jamison | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: 140 lbs | Hammer Drop: 30 inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
5	7	1.0	11, 11, 16, 10	Well graded sand and gravel sized rounded to subangular fragments of weathered limestone; chalky white to tan; very moist to saturated. Saturated at 6.5 feet below land surface. Color change from chalky white to tan-gray at approximately 6.5 feet below land surface.
10	12	1.0	5, 10, 12, 26	Well graded sand and gravel sized rounded to subangular fragments of weathered limestone; dark gray; saturated; strong anaerobic odor.
15	17	1.5	1, 1, 1, 1	Clay and silt; soft with cohesiveness decreasing with depth; dark gray and black; saturated; no odor. Shell fragments throughout bottom part of spoon.
20	22	2.0	1, 2, 4, 5	Clay and silt with some very fine sand; soft; cohesive; rollable; olive green to blue gray; no odor.
25	27	2.0	2, 3, 7, 7	Clay and silt with little very fine sand; moderately dense; cohesive, rollable; brown-tan; moist; no odor.

SAMPLE/CORE LOG

Boring/Well: GM-19 | Project No.: NJ0293.001 | Page: 1 of 1

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/20/95 | Drilling Completed: 6/20/95

Total Depth Drilled: 22 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 5 feet

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Wes Jamison | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: 140 lbs | Hammer Drop: 30 inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
0	2	2.0	3, 5, 5, 7	Limestone fill with clay and silt and some organic matter; soft; cohesive; rollable; gray and black;. moist; no odor.
5	7	2.0	4, 5, 5, 7	Clay and silt with some very fine sand and trace shell fragments; soft, cohesive, rollable, brown; moist; no odor.
10	12	2.0	3, 5, 6, 9	Clay and silt with some very fine sand and trace shell fragments; soft, cohesive, rollable, light brown with pockets of gray; moist; no odor.
15	17	2.0	7, 10 17, 19	Silt and clay with some very fine to medium sand; medium density; cohesive; slightly rollable; brown to tan; moist; no odor.
20	22	2.0	5, 7, 10, 14	Silt and clay with some very fine to medium sand and trace gravel size, rounded fragments of weathered limestone; medium dense; cohesive; slightly rollable; brown to tan with black streaks; moist; no odor.

SAMPLE/CORE LOG

Boring/Well: GM-14 | Project No.: NJ0293.001 | Page: 1 of 2

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/22/95 | Drilling Completed: 6/22/95

Total Depth Drilled: 37 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device 24 inches by 2 inches | Sampling Interval: 5

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Wes Jamison | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: 140 lbs | Hammer Drop: 30 inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
5	7	1.2	3, 3, 4, 4	Clay and silt with little fine sand, and trace coarse sand and gravel size limestone fragments; soft; cohesive; slightly rollable; dark gray with pockets of brown and light gray; moist; no odor.
10	12	2.0	push	Silt and clay with trace, very fine sand; very soft; cohesive; nonrollable; blue-gray; very moist to saturated; no odor. Little shells and organic matter throughout spoon.
15	17	1.7	3, 3, 4, 4	Silt and clay with trace very fine sand, very soft; cohesive; nonrollable; blue-gray; very moist to saturated; no odor.
20	22	2.0	3, 5, 6, 7	Silt and clay with trace very fine sand and fine well rounded gravel; moderately dense, cohesive, rollable; blue-gray; very moist to saturated.
25	27	2.0	3, 4, 6, 7	Silt and clay with little very fine sand; dense; moderately cohesive; slightly rollable; light green-gray to brown with black streaks; no odor.

SAMPLE/CORE LOG

Boring/Well: GM-14 Project No.: NJ0293.001 Page: 2 of 2

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
30	32	1.8	3, 4, 8, 12	Silt and clay with little very fine sand and few coarse sand to gravel size fragments of limestone; dense, moderately cohesive; slightly rollable; light green-gray to brown with black streaks; no odor.*
35	37	2.0	3, 5, 6, 9	Silt to coarse gravel size fragments of highly weathered limestone; very soft; nonrollable; chalky white; saturated; no odor.

*Lithologic change at approximately 31.5 feet below land surface; lagoonal silt and clay to weathered limestone.

SAMPLE/CORE LOG

Boring/Well: GM-22 | Project No.: NJ0293.001 | Page: 1 of 1

Site Location: Vialco, St. Croix, USVI | Drilling Started: 6/21/95 | Drilling Completed: 6/21/95

Total Depth Drilled: 32 feet | Hole Diameter: 7 inches | Type of Sample/ Coring Device: Split Spoon

Length and Diameter of Coring Device: 24 inches by 2 inches | Sampling Interval: 5 feet

Drilling Fluid Used: None | Drilling Method: Hollow Stem Auger

Drilling Contractor: CHT, St. Croix | Driller: Wes Jamison | Helper: Ibu's crew

Prepared by: Derek McGregor | Hammer Weight: 140 lbs | Hammer Drop: 30 inches

Sample/Core Depth (feet below land surface) From	To	Core Recovery (feet)	Time/Hydraulic Pressure or Blows per 6 inches	Sample/Core Description
5	7	2.0	3, 5, 5, 7	Silt and fine sand with little clay; very soft; nonrollable; red, no odor. Resembles material from red mud pile.
10	12	2.0	1, push	Silt and fine sand with little clay; very soft; nonrollable; red, moist no odor.
15	17	1.5	1, push	Silt and clay with some fine sand; very soft; nonrollable; red, very moist.
20	22	2.0	1, push	Silt and clay with some fine sand; very soft; nonrollable; red, very moist to saturated. Saturated at approximately 21 feet below land surface.
25	27	2.0	1, push	Silt with some very fine grain sand and little clay; very soft; blue-gray; moderate odor.*
30	32	1.8	1, 1, 1, 1	Clay and silt with some very fine sand; slightly dense; somewhat rollable; brown-tan with black streaks, moist; no odor.

* Lithologic change at approximately 22 feet below land surface; red mud to marine lagoonal silt and clay.

WELL CONSTRUCTION

Hole Diameter	: 8 inch
Type of Augers	: Solid Stem Auger

WELL CASING

Material	: Fiberglass
Diameter	: 4 inch
Joints	: threaded

WELL SCREEN

Material	: Stainless Steel
Diameter	: 4 inch
Joints	: threaded
Opening	: 0.01 slot
Length	: 10 ft.
Sand Pack	: 20/30
Sand Pack Seal	: Bentonite Pellets
ANNULUS SEAL	: Cement Grout

NOTES

St. Croix Alumina
Observation Well

Measurable PSH encountered.

EXECUTIVE SUMMARY

The United States Environmental Protection Agency's (EPA), Region II Superfund Pre-Remedial and Removal Programs are performing an Integrated Assessment (IA) of the St. Croix Alumina Site (the Site) in St. Croix, U.S. Virgin Islands (USVI). As part of the IA, a radiological assessment is specifically being conducted to support the Removal Site Evaluation (RSE) for the Site. An Airborne Spectrophotometric Environmental Collection Technology (ASPECT) gamma flyover survey was conducted in July 2011 to aid in identifying areas of potential radiological concern in support of subsequent ground-based radiological investigations. The ASPECT identified the Red Mud Disposal Area A (RMA) within the Site as the main location of radiation anomalies.

Subsequently, in September 2011, as part of the overall IA fieldwork, EPA performed ground-based radiological assessment of the Site and the adjacent residential communities (Harvey and Matthews Charles) located north of the Site. Radiation levels and radionuclide concentrations within the Site exceeded the action levels generally used at Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) cleanup sites under both residential and industrial settings. The primary contaminants at the Site are thorium-232 (Th-232), which has a half-life of 14 billion years, and its decay products. The gamma radiation levels measured in the residential communities were within the natural background levels.

The average background exposure rate was measured at 3.6 micro-Roentgen per hour (μR/h). The exposure rates within the RMA ranged from 22 to 61 μR/h. All the red mud related exposure rate measurements collected from the Site were in excess of the exposure rate of 20 μR/h specified in 40 CFR 192.12(b)(2) that is set as a goal to be achieved after a remediation of a given site. The sum of thorium (Th-230 and Th-232) and the sum of radium (Ra-226 and Ra-228) background concentrations are less than 1 pico-Curie per gram (pCi/g). The sum of thorium (Th-230 and Th-232) and the sum of radium (Ra-226 and Ra-228) concentrations in essentially all red mud and sediment samples (100 total samples) taken from the Site ranged from 6 to 29 pCi/g. Such concentrations are in excess of the residential and industrial 5 pCi/g limit specified in 40 CFR 192. In surface water the sum of radium concentrations as high as 27 pCi/L were detected, indicating the transport of radiological contaminants from the northern to the southern parts of the Site via surface water runoff, resulting from rain events. The

radionuclide concentrations in all on-site monitoring wells were well below the Maximum Contaminant Level (MCL) specified in the Safe Drinking Water Act (SDWA).

The radionuclide concentrations found on-site exceed EPA risk-based guidelines for residential and industrial use scenarios for chronic, long-term exposures. However, an imminent and substantial endangerment is not anticipated as a result of exposure to site-related radiological contaminants under the current use scenario. Human exposure to radiation is currently limited because areas impacted by red mud are not frequented by workers or trespassers. There is not a currently completed chronic health effect exposure pathway. However, the presence of such a large volume of radioactive material on-site requires that future land use be considered prior to any remediation or redevelopment efforts. Exposures to these materials may increase the risk of developing a radiogenic cancer. This carcinogenic risk is a chronic, or long-term health risk. Future health risks would be reduced by implementing appropriate engineering controls at the Site.

Additional data collection is necessary to evaluate the potential for contaminant releases to off-site areas. Specifically, radon and thoron gas monitoring both on- and off-site is necessary to complete the RSE. It is also recommended that water and sediment in cisterns within the Harvey community be sampled for radionuclides.

1.0 INTRODUCTION

The United States Environmental Protection Agency (EPA) is performing an Integrated Assessment (IA) at the St. Croix Alumina Site (the Site) in St. Croix, United States Virgin Islands (USVI). The IA is being conducted under the Authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA). The IA includes the collection of environmental data to support both the Superfund Pre-Remedial Hazard Ranking System (HRS) process and the Superfund Removal Program's Removal Site Evaluation (RSE). The IA sampling at the Site took place between September 12 and September 23, 2011. Part of the data collection included sampling and analysis of environmental media (waste material, soil, sediment, surface water and groundwater) for radiological assessment. The purpose of the radiological assessment is to determine Site conditions in terms of radioactivity and the potential for radioactive material migration both on- and off-site. The focus of this report is to discuss results of the radiological samples collected during the IA. Other chemical data collected during the IA sampling are addressed in the Weston Solutions, Inc. report entitled *Expanded Site Inspection and Removal Assessment Report, St. Croix Alumina (Renaissance Park) Site, St. Croix, U.S. Virgin Islands (ESIRA),* dated May 2012.

The Site was a former aluminum ore refinery that extracted alumina from bauxite. Bauxite is a naturally occurring, heterogeneous material composed primarily of one or more aluminum hydroxide minerals (principally gibbsite, boehmite, and diaspore) plus various mixtures of silica (SiO_2), iron oxide (Fe_2O_3), titania (TiO_2), aluminosilicates (clay, etc.), and other impurities in trace amounts. Bauxite was refined on-site using the Bayer process, which involved drying, crushing, and grinding of the ore; dissolution of alumina with caustic soda at high temperatures and pressures; separation and on-site disposal of the undigested solid residues; precipitation as alumina hydrate; and washing, filtration, and calcination of the hydrate to form crystalline alumina (Al_2O_3).

The principal waste generated by bauxite processing was red mud, which consists primarily of the undigested metal oxides that precipitate and settle out of the process solution. Red

mud contains elevated levels of metals and has a pH ranging from 10 to 12 due to the use of caustic soda during the extraction process. Red mud can also contain low levels of Technologically-Enhanced, Naturally-Occurring Radioactive Material (TENORM), usually from the thorium and uranium series radionuclides that are present in some bauxite ores. Other metals constituents may include barium, boron, cadmium, chromium, cobalt, gallium, lead, scandium, and vanadium. The types and concentrations of minerals present in the mud depend on the composition of the ore and processing conditions. The use of sodium hydroxide to dissolve aluminum oxide from the ore caused lower solubility compounds, including thorium and uranium, to concentrate in the residues (*i.e.*, red mud).

1.1 Site Background

The Site background details reported herein are based on the ESIRA. The Site is located within the industrial corridor along the south-central coast of St. Croix, United States Virgin Islands (USVI). The Site, which consists of several parcels and has a total surface area of approximately 1,250 acres, is currently owned by St. Croix Renaissance Group, LLLP (SCRG). The property is zoned for industrial use and is bordered by the HOVENSA oil refinery to the east; USVI government property (the Container Port and Molasses Pier) to the southeast; the Caribbean Sea to the south; the Anguilla Dump, the Randall "Doc" James Racetrack, and the Henry E. Rohlsen Airport to the west; and the Bethlehem Village/Profit Hills (Harvey) and Estate Profit (Matthews Charles) residential neighborhoods across a four-lane highway to the north. A Site Location Map and Site Features Map are presented in Appendix A, Figures 1 and 2, respectively.

The alumina refinery operated from 1968 through December 2000 under various owner/operators including Harvey Aluminum, Inc. and Martin Marietta Alumina from 1968-1985; Virgin Islands Aluminum Company (VIALCO) from 1989-1995; and St. Croix Alumina, LLC (SCA), a subsidiary of Aluminum Company of America (ALCOA), from 1998-2001. SCRG purchased the property from ALCOA in 2002 and has since begun redevelopment of the Site, including the removal of former refinery tanks and equipment. In addition, the Diageo rum distillery located on the northern

portion of the property was constructed in 2009-2010 and began operating in November 2010.

From the onset of operations in 1968 until the early 1970s, the red mud was deposited on-site in red mud ponds, designated herein as Red Mud Disposal Area B (RMB). This area is located on the central portion of the Site, south of the former refinery (Appendix A, Figure 2). RMB, which was built on top of a mangrove swamp, covers approximately 81 acres and consists of seven disposal cells surrounded by perimeter dikes constructed of carbonate material. The red mud deposited in RMB was approximately 30 percent solids and 70 percent liquids, with the liquids being a mixture of caustic soda and seawater. The dikes were constructed of carbonate sand mixed with clay to heights of 15 to 30 feet above existing grade. Excess liquid drained to a dewatering pond in the southeastern portion of the source area (this pond was subsequently used for bottom ash disposal, as described below). An estimated total of 1,229,149 tons of red mud were deposited into RMB. The disposal area was partially covered with limestone fill and some of it has re-vegetated, but there are several exposed areas and associated runoff routes. Direct-push borings completed in 2010 encountered red mud to depths greater than 24 feet below ground surface (bgs) in RMB.

Beginning in the early 1970s, extensive amounts of red mud were placed in an area in the northwest corner of the Site, designated herein as Red Mud Disposal Area A (RMA) (Appendix A, Figure 2). Due to a modification in the separation process, the composition of the red mud slurry changed at that time to 50 percent solids and 50 percent liquids, with the liquids still being a mixture of caustic and seawater. After 1983, the slurry also included fly ash from the coal-fired boiler. RMA was subdivided into seven disposal cells of diked red mud that covered approximately 62 acres. The red mud slurry was deposited in RMA using a process called “dry stacking”, whereby the slurry was pumped into the RMA cells to form a natural slope and allowed to dry for about 6 months. The residue was then bulldozed and compacted. An estimated total of 4,613,449 tons of red mud were deposited into RMA. Boreholes completed in 2006 indicated red mud thicknesses of 28 to 60 feet bgs within RMA. The surface of

the RMA red mud is practically devoid of vegetation, leading to massive erosion and runoff from this area since 2001. There was a documented release of red mud to mangrove swamps to the south in 2002, and red mud-laden runoff continues to flow overland into the on-site Red Mud Settling Pond (RMS) and the Upper Cooling Pond (UCP).

Red mud in both disposal areas has been shown to maintain high pH levels and contain elevated levels of arsenic, chromium, mercury, selenium, and vanadium. A 1993 analysis of red mud indicated the presence of elemental thorium and uranium.

Other wastes generated as a result of power production were also deposited in areas of the Site. As described above, fly ash from the coal-fired boiler was mixed with red mud prior to disposal in RMA beginning in 1983. The bottom ash from the coal-fired boiler was deposited in the former RMB dewatering pond, designated herein as the Ash Disposal Pond (ADP). Historic laboratory analysis of waste samples from ADP has indicated the presence of arsenic, chromium, mercury, selenium, and vanadium. A direct-push boring completed in 2010 encountered black ash to a depth of 15.5 feet in the ADP.

The Former Bauxite Storage Area (FBS) located on the eastern portion of the Site is a large open air and roofed shed where bauxite ore was stored while the alumina refinery was operational. When the refinery ceased operations, some unprocessed bauxite was left in the FBS. Alumina and red mud from the decommissioning of tanks and other equipment were added to the bauxite pile upon shutdown, and the FBS was used to stage some debris. The FBS shed currently contains a pile with a maximum height of about 15 feet that covers approximately 1 acre. The pile consists of a mixture of red mud, alumina, bauxite, and debris, with residual red mud from equipment decommissioning operations covering the surface.

The alumina refinery used approximately 50 million gallons per day of cooling water pumped from the Alucroix Channel and subsequently discharged into two ponds constructed in the early 1970s: the 30-acre UCP and the 150-acre Lower Cooling Pond

(LCP). These caliche-lined holding basins on the western and southern portions of the property were constructed for cooling water retention, treatment of process water and retention, and treatment of storm water. The LCP was initially constructed with twenty outfalls, however; silting problems occurred which plugged the outfalls. One primary discharge point to the shipping channel has been used since 1981. This outfall is regulated through a Territory Pollution Discharge Elimination System (TPDES) permit issued by Virgin Islands Department of Planning and Natural Resources (VIDPNR) and is designated as Outfall 001A.

1.2 Aspect Investigation

In June 2011, EPA requested the Airborne Spectrophotometric Environmental Collection Technology (ASPECT) to conduct radiological surveys over the Site and surrounding areas. The ASPECT flyover survey was conducted on July 19 and 21, 2011. The ASPECT flyover results were provided in the EPA report titled *Aerial Chemical and Radiological Surveys, St. Croix Alumina and HOVENSA LLC Sites, St. Croix, Virgin Islands*, dated August 2011.

Over 2,300 one-second spectra were collected during the radiological surveys. Results of the survey indicated thorium concentrations in the RMA portion of the Site that were above background levels. The estimated concentrations reported by the ASPECT flyover survey for equivalent thorium-232 (eTh) and equivalent uranium/radium (eU/eRa) in RMA were 7 picocuries per gram (pCi/g) and 1 pCi/g, respectively. The eTh and eU concentrations determined from the aerial measurements in the neighborhood areas to the north were about 0.18 pCi/g and 0.09 pCi/g, respectively. These measurements are consistent with background levels on St. Croix and other soils in this region of the world. The average gamma exposure rate as estimated by ASPECT in background areas surrounding the Site was about 2 microRoentgens per hour (μR/h). This measurement excluded contributions from cosmic radiation at levels of about 3.2 μR/h. The average exposure rate measurement taken over RMA was 17 μR/h (20.2 μR/h including cosmic contribution). These results suggested that the average exposure rate from the red mud is about 9 times higher than local background.

The ASPECT results are expected to be lower than the actual ground surface exposure rate results because of averaging over the larger aerial extent. The purpose of the ASPECT fly over was to provide information about the homogeneity or heterogeneity of radioactivity at the Site and to aid in determining which areas would need to be further investigated or focused on during ground-based radiation surveys.

1.3 Ground Radiological Assessment Objectives

The ground radiological assessment completed as part of the IA had the following objectives:

- Determine the presence and characterize the levels of radioactive materials in the red mud.
- Determine the extent of radioactive contamination at the Site in other media such as surface water, sediment, and ash.
- Determine if radiological contamination exists in on-site groundwater wells.
- Determine if additional on-site radiation monitoring or sampling is necessary.
- Determine if off-site radiation sampling is necessary.
- Provide data that can be used to evaluate human health risks associated with radiation from the Site and make appropriate recommendations.

2.0 RADIOLOGICAL INVESTIGATIONS

The ASPECT flyover gamma survey was conducted to focus the ground-based field investigations that would provide the information necessary to perform the RSE. The ground survey activities were designed to characterize the radionuclide content of several media including surface and subsurface waste (red mud, ash, and sediment), surface water, and groundwater. The following sections discuss the different types of radiological sampling conducted on- and off-site.

2.1 Radiological Background Surveys

A background study area located on the northeast portion of the Site was used to determine the background gamma count rate, background exposure rate levels, and the soil background radionuclide concentrations. Soil background levels in non-impacted areas on-site are compared to radionuclide concentrations in areas impacted by red mud and other potential contamination to be able to assess increases above local background due to site-related conditions.

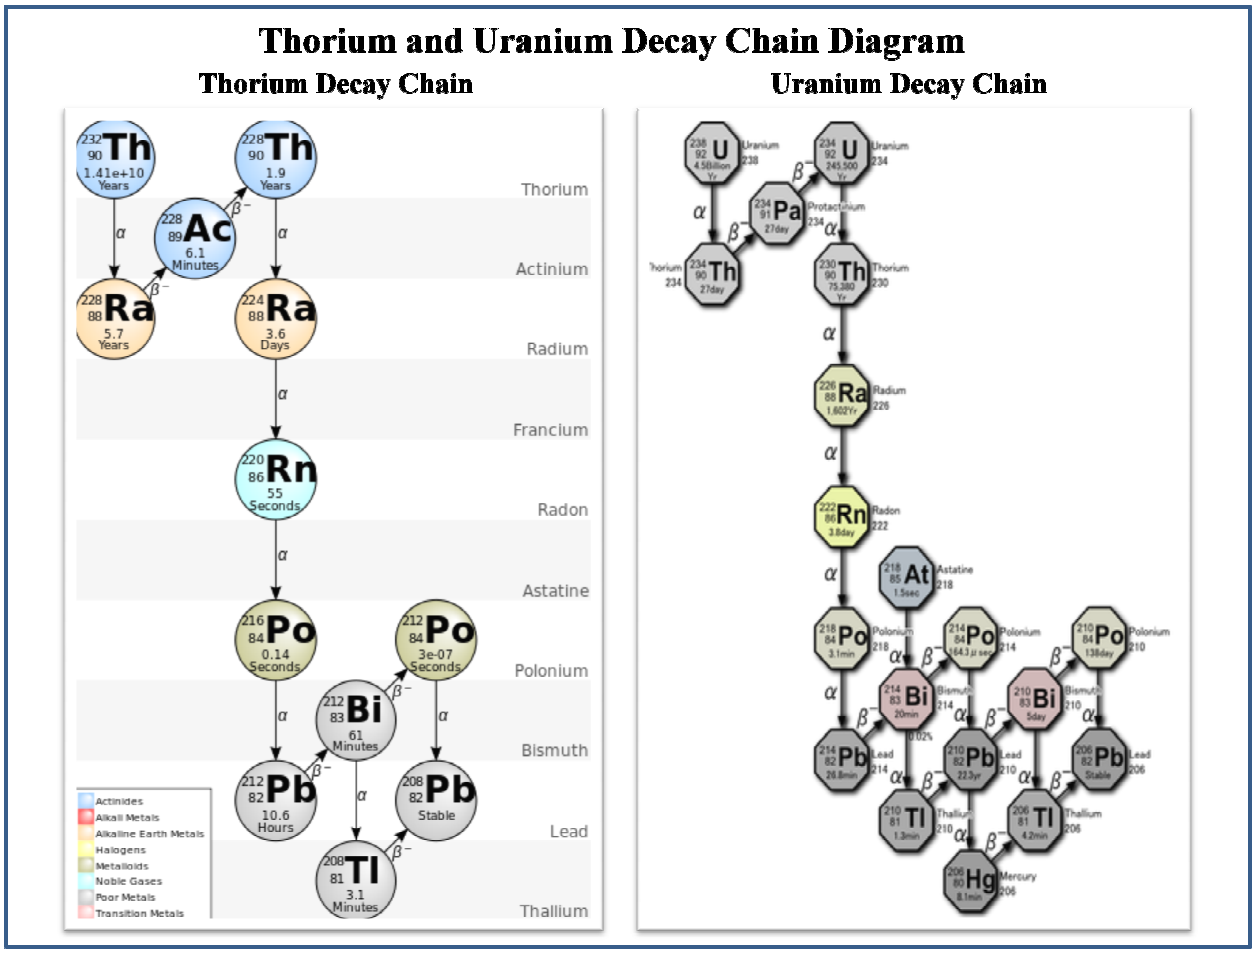
2.2 Gamma Count Rates and Exposure Rates

In order to identify any potential off-Site migration of radiological contaminants, gamma count rate surveys were conducted along the northern fence line of the Site and off-site in Matthews Charles (Pedro Cruz Baseball Stadium and recreational area) and in various areas within the Harvey community (Bethlehem Village and Profit Hills). The gamma count rate surveys were conducted using the EPA Rapid Assessment Tools (RAT) system, which consists of a Ludlum Model 2241 Scaler/Ratemeter coupled with Ludlum 44-10 (2" x 2") NaI gamma scintillation detector and a Global Positioning System (GPS). The surface gamma count rate data over the surveyed areas were then plotted and compared to the surface background gamma radiation levels.

Surface gamma exposure rate measurements were also collected on-site on the red mud pile located in RMA. The exposure rate measurements were collected on contact with ground surface and at waist height (1 meter above ground surface). The on-site gamma exposure rate surveys were conducted using a Ludlum Model Ludlum Model 19 MicroR

survey meter with a built-in 1" x 1" NaI(Tl) Gamma Scintillator. The exposure rate data along with the coordinates were logged on a GPS unit. The exposure rate data were then used to generate isopleths of the surface exposure rates over RMA.

2.3 Surface and Subsurface Volumetric Sampling



A total of 111 volumetric samples, including duplicate samples, were collected for radiological analysis. These samples included the following media:

- Eleven (11) background soil samples: 10 soil samples were collected from the northeast portion of the Site. One background soil sample was collected off-site near the entrance of the Anguilla Dump located west of the Site;
- Seven (7) samples collected from the RMA Depositional Area located south of RMA;
- Forty-four (44) red mud samples collected from RMA. Subsurface samples in RMA were collected by horizontal coring from within existing crevices that were caused by erosion in order to facilitate sample collection at depth;
- Twenty-two (22) red mud samples collected from RMB;
- Four (4) red mud samples collected from the FBS ;
- Five (5) ash samples collected from the ADP area;
- Six (6) Sediment samples collected from the RMS, the ADP area, the LCP, and the UCP;
- Five (5) surface water samples collected from RMA, the RMS, and the UCP; and
- Seven (7) groundwater samples collected from seven existing monitoring wells located on the Site.

3.0 RELEVANT RADIATION FACTS

There are three naturally occurring radioactive decay chains which are known as the uranium chain (of which Ra-226 is a member), the thorium chain (of which Ra-228 is a member), and the actinium chain. The radionuclides of concern present in site-related red mud wastes are primarily members of the thorium chain and to a lesser degree of the uranium chain.

The uranium and thorium decay chain diagram is shown below. There are 14 unique radionuclides in the uranium chain and 11 unique radionuclides in the thorium chain which precede the formation of stable lead (Pb-206 or Pb-208). Alpha, beta, and gamma radiation are emitted from the various members of the two chains. One of the more prevalent radionuclides is Ra-226, the sixth member of the uranium chain. It emits alpha particles and gamma rays and has an approximate half-life of 1,620 years. Its immediate decay product is gaseous radon (Rn-222; half-life of 3.8 days). An estimated average of 229 millirem per year (mrem/yr) would result from the inhalation of the decay products of indoor Rn-222 gas when present in background concentrations. Radon-222 is produced by the decay of Ra-226. Radon gas is mobile and commonly migrates from soil into structures. An elevated Ra-226 concentration in soil underlying and adjacent to a structure will often result in a high concentration of indoor radon, especially in the lowest level of the structure. Since radium is ubiquitous in soil, there is always some level of radon in both outdoor and indoor air. The national average of indoor radon concentrations is approximately 1.3 picocurie per liter (pCi/L) in the absence of any enhanced radium sources.

The largest contribution to the background radiation dose received by most people results from the decay of radon progeny, which can reach significant concentrations in indoor air where they may become electrostatically attracted to respirable dust particles. Once inhaled, the particles may deposit within the bronchial passages where the radon progeny will decay, irradiating nearby tissue primarily with alpha particles (and to a lesser extent with beta particles and gamma rays).

The thorium series radionuclides include a different gaseous isotope of the element radon-220, commonly known as thoron, which has a half-life of 56 seconds. Thoron gas (Rn-220, a decay product of Th-232) is generally not a major contributor to the inhalation dose due to the extremely short half-lives of thoron and its decay products. However, if there are elevated sources of thorium-bearing materials within, beneath, or adjacent to a structure (such as the thorium and Ra-228 found in the red mud), thoron gas and its decay products may contribute a significant radiation dose via the inhalation pathway.

4.0 RELEVANT REQUIREMENTS AND THRESHOLDS FOR RADIOLOGICAL LEVELS

This section is included for data comparison purposes to assess the radiological levels found at the Site against relevant federal requirements and thresholds. Table 4-1 below lists the relevant requirements in thresholds that are used for guidance purposes to evaluate the data collected at the Site.

Table 4-1: Relevant Requirements and Thresholds for Radiological Levels

Type	Pertinent Standard or Guideline	Source
Radon and Thoron Indoor Concentration	4 pCi/L	EPA 1992
Radon/thoron decay progeny	0.02 Working Level (WL)	40 CFR 192
Radon and Thoron Outdoor Concentration	20 pCi/m^2-sec	40 CFR 61 (Rad NESHAP), Subpart W
Soil: Radium Other Radionuclides Exposure Rate	 Sum of Ra-226 and Ra-228: 5 pCi/g Sum of Th-230 and Th-232: 5 pCi/g 20 μR/h	40 CFR 192
Groundwater: Radium Gross alpha, Beta and gamma Uranium	 Sum of Ra-226 and Ra-228: 5 pCi/L, Adjusted gross alpha (Not including radon or uranium): 15 pCi/L, Beta/gamma: 4 mrem/year Total uranium: 30 μg/L	Safe Drinking Water Act (SDWA)
All Pathways	Cancer Risk range E-6 to E-4 or 15 mrem/yr	OSWER Directive No. 9200.4-18

The EPA Office of Solid Waste and Emergency Response (OSWER) Directive No. 9200.4-25, *Use of Soil Cleanup Criteria in 40 CFR Part 192 as Remediation Goals for CERCLA sites* (USEPA, 1998a), describe the relevance at CERCLA sites of the 40 CFR Part 192 standards that establish cleanup levels at uranium mill tailing sites. When thorium and/or radium contaminants are present in soil at a site, the 5 pCi/g surface concentration for radium may be suitable if found to be protective, based on Site use scenarios, receptors, and exposure pathways. Because the radioactive waste residues located at the Site are similar to

uranium mill tailings waste, the 5 pCi/g radium standard is appropriate and relevant for use as comparison criteria for the Site. OSWER Directive No. 9200.4-25 also addresses waste that contains commingled radium and thorium such as the waste residues found at the Site. The 5 pCi/g in 40 CFR Part 192 standard for radium pertains to the sum of the concentrations of Ra-226 and Ra-228. Compliance with the standard mandates that Th-230 (the parent radionuclide of Ra-226) and Th-232 (the parent radionuclide of Ra-228) must be limited to the same concentrations as their radium decay products to prevent future buildup (due to radioactive in-growth) of the radium isotopes to concentrations that exceed the standard. Therefore, the standards also apply to the sum of Th-230 and Th-232. The exposure rate of 20 μR/h specified in 40 CFR 192.12(b) (2) is set as the goal to be achieved after the remediation of a given site.

Risks due to exposure to radon/thoron and their progeny (40 CFR Part 192 – 0.02 WL) may need to be evaluated depending on the Site's future use. EPA has established indoor exposure guidelines in the 1992 Citizen's Guide to Radon (USEPA, 1992a). The National Emission Standards for Hazardous Air Pollutants (40 CFR 61), subpart W, sets standards for protecting the public and the environment from the emission of Rn-222 from uranium mills and their associated tailings. The standard limits the Rn-222 emissions rate to 20 picocuries per square meter per second (20 pCi/m^2-sec).

EPA has also adopted a policy of establishing dose-based and risk-based guidance for limiting the risk to the general public from exposure to residual radioactivity. OSWER Directive No. 9200.4-18 (1997), *Establishment of Cleanup Levels for CERCLA Sites with Radioactive Contamination,* advises that if a dose assessment is conducted at a site, then an effective dose equivalent of 15 mrem/yr above background should generally be the maximum dose limit for humans. This annual dose would achieve a lifetime risk level of approximately 3×10^{-4}, which is a level generally considered protective and consistent with the risk reduction objectives of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (EPA, 1997). Since annual dose equivalent (from all pathways) cannot be directly measured, dose assessment models must be utilized to relate medium-specific radionuclides of concern to an annual dose under a defined, appropriate land use

scenario. The 15 mrem/yr dose equivalent is a guidance level that is used to help establish cleanup levels for radioactively contaminated sites.

The relevant requirements and thresholds discussed above can be used as a reference to evaluate the IA data; however, annual doses and lifetime risk levels may need to be evaluated at the Site through a baseline human health risk assessment based on current and future use scenarios. Typically, EPA generates cleanup levels for radiological sites based on a site-specific risk assessment process.

5.0 NATURE AND EXTENT OF CONTAMINATION

The radioactive contaminants of concern at the Site are all naturally occurring constituents in most rocks and soils. Most soils and rocks indigenous to the northeast United States have thorium, radium, and uranium concentrations ranging from 0.5-1 pCi/g. Caribbean soils typically exhibit less than 0.5 pCi/g of these radionuclides. The background concentrations for Th-232 and eU/eRa (equivalent uranium and radium), determined from the ASPECT flyover survey in the neighborhood areas to the north of the Site, were about 0.09 pCi/g and 0.18 pCi/g, respectively. The ASPECT background measurements for thorium and uranium are reasonably consistent with those found in Cuba (0.09 pCi/g and 0.32 pCi/g, respectively). Background sources of radiation include terrestrial, cosmic, cosmogenic, and internally deposited radionuclides. The terrestrial component consists of several radionuclides including all members of the thorium and uranium decay chains, which are the radionuclides of potential concern at the Site.

On-site field investigations included surface gamma scans, exposure rate measurements, surface and subsurface soil/waste sampling (*i.e.,* red mud, ash, and sediment), and surface water and groundwater sampling. Only gamma scans were conducted in off-site areas.

5.1 Background Surveys

Background surface gamma count rate and exposure rate surveys were performed on the northeast portion of the Site. The results of the background gamma count rate and exposure rate surveys are shown in Appendix B, Table 5-1 and Table 5-2, respectively. The average background gamma count rate and exposure rate were approximately 5200 counts per minute (cpm) and 3.6 μR/h, respectively. Background soil samples were also collected from the northeast portion of the Site and from near the entrance to the Anguilla Dump located west of the Site. The results of the background soil samples are shown in Appendix B, Table 5-3A and Table 5-3B. Table 5-3A shows the results of the gamma spectroscopy analyses for Th-232, Ra-226, Ra-228, and U-238. Table 5-3B shows the results of isotopic analyses for Th-230, Th-232, U-234, U-235, and U-238. Since the isotopic analyses by alpha spectroscopy are generally more accurate than the gamma spectroscopy analyses, only Ra-226 and Ra-228 results were evaluated from the

gamma spectroscopy analyses along with the thorium and uranium alpha spectroscopy analyses. The background radionuclide concentrations in this evaluation are listed in Appendix B, Table 5-3C. The background concentrations of Th-230 and Th-232 are 0.46 and 0.36 pCi/g, respectively. The background concentrations of Ra-226 and Ra-228 are 0.28 and 0.34 pCi/g, respectively. The background concentrations of U-234, U-235, and U-238 are 0.23, 0.02, and 0.23 pCi/g, respectively. The location and results of the background soil samples are depicted in Appendix A, Figure 8.

5.2 Off-Site Surface Gamma Surveys

A total of 3293 gamma count rate measurements were collected off-site in the neighboring residential communities (Bethlehem Village, Profit Hills, and Matthews Charles). The gamma count rate survey results collected in Harvey (Bethlehem Village and Profit Hills) ranged from 1160 to 3440 cpm (refer to Appendix A, Figure 4 Appendix B, Table 5-4). The gamma count rate survey results for the Pedro Cruz baseball field in Matthews Charles ranged from 1450 to 2800 cpm (refer to Appendix A, Figure 5 and Appendix B, Table 5-5). The gamma count rate survey results collected from the Pedro Cruz recreational area in Matthews Charles ranged from 1050 to 2770 cpm (refer to Appendix A, Figure 6 and Appendix B, Table 5-6). All surface gamma survey results collected in Harvey and Matthews Charles are below the average background gamma radiation levels measured in the non-impacted northeastern portion of the Site (*i.e.*, less than 5200 cpm).

5.3 On-Site Surface Gamma Count Rate and Exposure Rate Surveys

The surface gamma count rate survey results conducted along the northern fence line of the Site ranged from 1790 to 6810 cpm (refer to Appendix A, Figure 3 and Appendix B, Table 5-7). A total of 433 data points were measured along the Site's northern fence line. Six of those data points exceeded the average background gamma count rate and only two data points exceeded the average background by two standard deviations. We can conclude with 95% confidence that the latter two data points are distinguishable from the background level. It should be noted that the gamma count rate increased when the survey scan reached the northwestern corner of the Site, approximately 200 feet from the northwest corner of the RMA.

The on-site surface exposure rate survey focused on the RMA. The exposure rate measurements were collected on contact with the mud surface and at a height of one meter above the ground surface. The exposure rate data are shown in Appendix B, Table 5-8. The contact exposure rate measurements range from 24 to 61 μR/h. The one meter exposure rate measurements range from 22 to 58 μR/h. Both sets of measurements are essentially the same (*i.e.,* statistically indistinguishable from each other), reflecting the large expanse and volume of the red mud. The exposure rate measurements were approximately seven to seventeen times above the average background exposure rate of 3.6 μR/h. The exposure rate of 20 μR/h specified in 40 CFR 192.12(b) (2) is set as the goal to be achieved after the remediation of a given site. The contact exposure rates from the RMA survey are shown in Appendix A, Figure 7.

5.4 Soil/Waste (Red Mud/Ash) Sampling

The soil/waste samples comprised three matrices; red mud, sediment, and ash. The results from the analyses of the samples are listed in Appendix B, Table 5-9A (gamma spectroscopy analyses) and Table 5-9B (isotopic analyses by alpha spectroscopy). Since the isotopic analyses are generally more accurate than the gamma spectroscopy analyses, only Ra-226 and Ra-228 results will be evaluated from the gamma spectroscopy analyses. The net radionuclide concentrations (after subtracting the background concentrations) in this evaluation are listed in Appendix B, Table 5-9C. The following paragraphs provide summary descriptions of the results shown in Appendix B, Table 5-9C. The locations and results of all waste samples are depicted on Appendix A, Figure 9.

Red Mud Disposal Area A

A total of 44 red mud surface and subsurface (maximum depth of 8 feet) samples were collected for radionuclide analysis from RMA, including two duplicate samples. All samples exhibited thorium and radium concentrations in excess of the remediation criterion of 5pCi/g in 40 CFR 192. The sum of thorium (*i.e.,* sum of Th-230 and Th-232) in such samples ranged from approximately 6 to 25 pCi/g. The sum of radium (*i.e.*, sum of Ra-226 and Ra-228) ranged from approximately 11 to 27 pCi/g. The

radionuclide contaminant present in the highest concentration in all samples is associated with the thorium decay chain.

A total of seven samples were collected for radionuclide analyses from the RMA Depositional Area located south of the RMA, including one duplicate sample. All but one sample exhibited thorium and radium concentrations in excess of 5 pCi/g. The sum of thorium in such samples ranged from approximately 4 to 11 pCi/g and the sum of radium ranged from approximately 5 to 14 pCi/g. The radionuclide contaminant present in the highest concentration in each sample is associated with the thorium decay chain.

Red Mud Disposal Area B

A total of 22 red mud surface and subsurface (maximum depth of 8 feet) samples were collected for radionuclide analysis from RMB, including one duplicate sample. All samples exhibited thorium and radium concentrations in excess of 5 pCi/g. The sum of thorium in such samples ranged from approximately 7 to 25 pCi/g and the sum of radium ranged essentially from approximately 8 to 29 pCi/g. The radionuclide contaminant present in the highest concentration in each sample is associated with the thorium decay chain.

Ash Disposal Pond

A total of six samples were collected from the ADP area, including one duplicate sample. The samples were collected from three different locations within the ADP. One location included a sediment sample collected from the southern edge of the ADP. The other two locations included surface and subsurface ash samples collected from the southeast side of the ADP area. The sum of thorium and the sum of radium concentrations were below 5 pCi/g (2.5 pCi/g maximum).

Red Mud Settling Pond

One sediment sample (RMS-SD45) was collected from the RMS located south of RMA. Thorium and radium concentrations exceeded 5 pCi/g in the sample. The sum of thorium in the sample was approximately 11 pCi/g, and the sum of radium was approximately 15 pCi/g. The radionuclide contaminant present in the highest concentration was from the thorium decay chain.

Upper Cooling Pond

A total of three sediment samples were collected for radionuclide analysis from the UCP. The sum of radium concentrations ranged from 2 to 16 pCi/g. The sum of thorium concentrations ranged from approximately 3 to 12 pCi/g, with two samples exceeding 5 pCi/g. The thorium concentrations in the three samples showed a decreasing trend to the south.

Lower Cooling Pond

One sediment sample, number LCP-SD33, was collected from the west side of the LCP. The sum of radium and the sum of thorium concentrations were within background levels.

Former Bauxite Storage Shed

A total of three samples were collected from the red mud pile located in the FBS. The sum of thorium (5-12 pCi/g) and the sum of radium (7-12 pCi/g) in all three samples exceeded 5 pCi/g with the thorium decay chain being the primary contaminant. One red mud sample (FBS-WST43A), was collected from the drainage channel leading south from the shed. The sum of radium in that sample was 5.1 pCi/g. Radium-228, which is part of the thorium decay chain, was present in the highest concentration.

5.5 Surface Water Sampling

A total of six surface water samples were collected from the Site (Appendix B, Table 5-10). One sample (SW-RMA-WST12) was collected from the ponded rain water located on top of the RMA. The sum of radium in this sample was approximately 6 pCi/L. Further south, sample RMA-SW57 was collected from the storm water runoff from within a culvert that connects the RMA to the RMA depositional area to the south. The sum of radium of 27 pCi/L in this sample is indicative of contaminant migration from RMA to other southern areas of the Site. Sample number RMS-SW45 was collected from the RMS located south of RMA. The sum of radium of 18 pCi/L in this sample also indicates surface runoff is eroding red mud from the RMA and transporting radioactivity to other on-site locations.

Two surface water samples were collected from the UCP. Sample UCP-SW39, collected from the northern portion of the pond and closer to the RMA, exhibited a sum of radium concentration of approximately 11 pCi/L. Sample UCP-SW33, collected from the southern portion of the pond and further away from the RMA, exhibited a sum of radium concentration of approximately 1.2 pCi/L. The trend within the surface water samples shows radioactivity decreasing to the south.

5.6 Groundwater Sampling

A total of seven on-Site monitoring wells were sampled (Appendix B, Table 5-10). All wells exhibited radionuclide concentrations well below the Maximum Contaminant Level (MCL) specified in the Safe Drinking Water Act (SDWA).

6.0 CONTAMINANT FATE AND TRANSPORT

Isotopes of thorium and radium were detected at elevated levels in the red mud and red sediment samples collected from the Site. The radionuclides found at the Site in the highest concentrations are part of the Th-232 decay chain. Limited amounts of uranium series radionuclides (U-238 decay chain) were also identified in red mud and red sediment. For some radionuclides, persistence in the environment is driven by the kinetics of radioactive decay. However, the radiological contaminants of concern at the Site are long-lived nuclides (*i.e.*, their radioactive half-lives do not contribute significantly toward their environmental degradation). For example, the primary Th-232 radioactive metal present in the red mud has a half-life of 14 billion years. No appreciable change in the quantity of these radionuclides can be expected to result from radioactive decay. The mobility of thorium in soils may be limited due to both the formation of low solubility precipitates (*i.e.*, phosphates, oxides) and on the presence of clays and organic matter onto which the thorium adsorbs. Thorium and radium are relatively insoluble, so it is likely that transport to groundwater primarily would occur as colloids or as sorbed constituents on fine particles.

At this Site, the radionuclides are primarily transported on the surface via rainwater and wind action. Significant erosion was noted in the RMA and throughout other areas of the Site during the field investigation. Without proper erosion control, radiological contaminants found in the red mud will continue to spread.

High winds (especially during tropical storm and hurricane events) could potentially transport red dust from the Site to residential communities to the north (*i.e.*, Harvey and Matthews Charles). During recent EPA community outreach efforts in November 2011, red sediment was observed inside several cisterns in the Harvey community. Residents in the Harvey community reported to EPA that periodic red dustings, that they believe originate from the Site, occur during high wind events.

7.0 RADIOLOGICAL RISK EVALUATION

7.1 On-Site Risks

The radiological assessment of the Site identified contamination that could result in radiation exposures exceeding acceptable levels. The potential routes of exposure include external gamma radiation, inadvertent ingestion of particulate radioactive materials in red mud, and inhalation of radon/thoron decay products and respirable radioactive particulates. The most significant source of the radiation is the thorium series radionuclides found in surface and subsurface red mud and in the impacted Site surface water and sediment. Since the parent radionuclides have extremely long half lives and will continue to emit radiation for billions of years, Site conditions will remain unchanged unless remediated, and will outlast the useful lifetimes of existing buildings and other structures that may be constructed in the future. The radionuclide concentrations found in the red mud exceed EPA risk-based guidelines for residential and industrial use scenarios for chronic long term exposures. Applicable requirements that are protective of human health and the environment include the standards that limit the radium and thorium concentrations in soil to less than 5 pCi/g specified in 40CFR 192, radon surface flux to 20 pCi/m^2-sec in Subpart W of 40 CFR 61, radium and uranium in groundwater to less than the MCLs specified in the SDWA, and limit exposure to indoor radon and thoron gas to 4 pCi/L. Site-specific cleanup levels would be established based on a human health risk assessment using current and future Site use scenarios.

An imminent and substantial endangerment is not anticipated as a result of short-term exposures to Site radiological contaminants. However, long-term exposures to these materials may increase the risk of developing a radiogenic cancer at the levels observed on-site. This carcinogenic risk is a chronic, or long-term health risk. Chronic risks are best described as statistical probabilities based on models and risk coefficients that have been derived from numerous studies of radiation effects on various populations (*i.e.*, human, animal, and cellular). Chronic exposure to elevated levels of radiation may increase the risk of cancer. There is no unique radiogenic cancer type, nor can a diagnosis of a cancer be shown to be the result of radiation exposure. Some specific

associations have been observed such as the increased risk of lung cancer due to exposure to radon decay products.

Under the current use scenario, human exposure to radiation on-site is limited since areas impacted by red mud are not normally frequented by Site workers or Site visitors. Therefore, no adverse health effect exposure pathway currently exists. However, the presence of this large volume of radioactive material on-site requires that future land-use and engineering controls be considered during any remediation or redevelopment efforts. Future land-use scenarios must be evaluated to determine the exposure to potential future receptors (*i.e.*, Site workers, construction workers, trespassers, and residents). Appropriate remedial alternatives and future land-use restrictions should be evaluated. Future health risks could be reduced by implementing and maintaining appropriate engineering controls.

Given the large volume of red mud on-site, radon and thoron build-up may be a potential concern for occupants under certain future use scenarios. Since radon and thoron testing was not part of this investigation, a radon and thoron evaluation is necessary to assess their on-site flux on the red mud surface and the potential migration of such gases into future on-site structures. Inhalation of radon and thoron decay products could be the primary contributor to future human health risks associated with the radiological contaminants contained in the red mud depending on future site use.

7.2 Off-Site Risks

St. Croix is susceptible to hurricanes and other high wind weather events that could carry radionuclides off-site. There have been historic releases of bauxite into neighboring residential communities to the north that resulted in red material deposits inside residential domestic water supply cisterns (*i.e.*, Hurricane Georges in September 1998). Residents located north of the Site have reported red dust deposition on rooftops, inside cisterns, in outdoor gardens, and on indoor furniture associated with hurricanes and other high wind events.

Off-Site gamma surveys conducted by EPA did not identify elevated radiation levels in the soil in the neighborhoods located north of the Site. However, cisterns in these neighborhoods have not been sampled for radionuclides.

Radon and thoron accumulations, build-up of their particulate decay products on-site, and potential off-site migration may also be a possible concern. Radon and thoron decay product testing in indoor and outdoor areas was not part of this investigation. Based on data collected during the IA, radon and thoron data should be collected and evaluated to assess the on-site flux on the red mud surface and the potential generation and migration of radon/thoron gas and decay products to the adjacent residential communities to the north. Off-site human health risks could be associated with inhalation of radon and thoron decay products and with the inhalation of respirable radioactive particulates. Ingestion of radioactive particulates from within cisterns is a less likely risk driver.

7.3 Ecological Risk

The migration of the red mud, due to significant erosion, creates the potential for ecological exposures to radiation in the southern and central portions of the Site. An evaluation of the ecological threat from on-site radiation was not part of this assessment. Based on the results of this assessment, a radiological Screening Level Ecological Risk Assessment (SLERA) is recommended as part of a long-term Site cleanup plan.

8.0 CONCLUSIONS AND RECOMMENDATIONS

The radiological assessment has identified radiological contamination on-site that could result in exposure to unacceptable levels of radiation depending on future land use. The primary source of the radioactive contamination is the red mud that contains concentrations of thorium series radionuclides in excess of regulatory criteria. The majority of the potential risk is via exposure to external gamma radiation, and possibly from inhalation of radon and thoron decay products. Currently, levels of radiation in on-site media exceed health based EPA guideline criteria. A baseline risk assessment would be required to identify exposures that could result in elevated risks of cancer to either current and/or potential future receptors. Because the areas of elevated radioactivity are not accessed frequently by workers or trespassers under the current use, the Site conditions are not expected to pose an unacceptable risk to the current occupants. Although the radionuclide concentrations would not be expected to pose an unacceptable ecological risk, a formal SLERA to document the risk is recommended.

Recommendations for Additional Data Collection

The following additional data should be gathered to further evaluate the extent of radiological contamination:

1) The on-site and off-site investigations did not include radon and thoron measurements. Preliminary assessment of radon and thoron in outdoor on-site and off-site areas is necessary to assess potential exposure to on-site workers and off-site communities. These data would be used to supplement the RSE.

2) Sediment deposits in residential cisterns in the Harvey community observed during EPA's November 2011 community outreach work should be sampled and analyzed for radionuclides. These data would be used to supplement the RSE.

Recommendations for On-Site Remediation

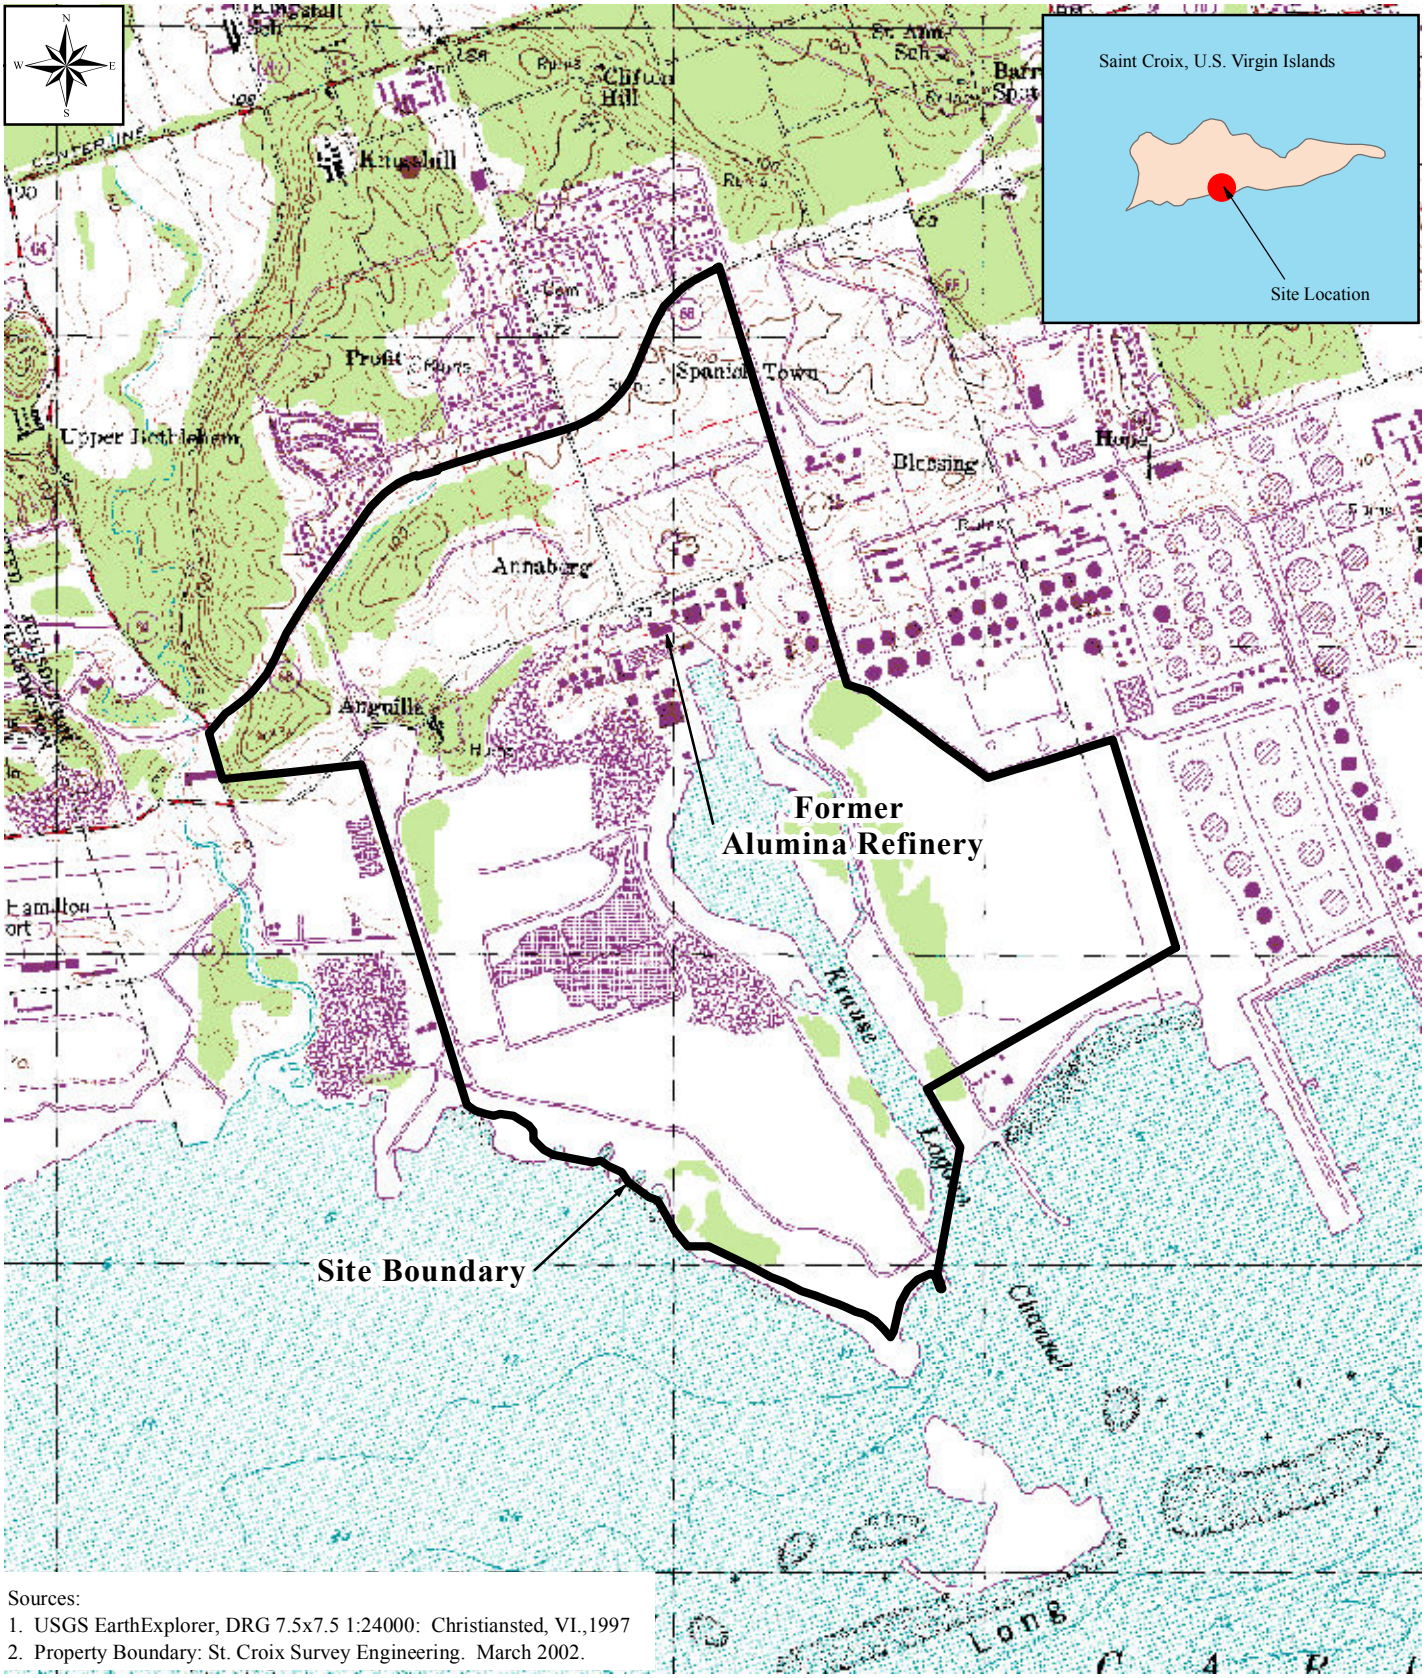
In the short term, the spread of radioactive contamination by surface water runoff should be controlled through the implementation of engineering controls. On-site surface water generated from rainfall acts as transport mechanism of radionuclide contamination from the northern to the southern portions of the Site. Any cleanup action must prevent the direct interaction of surface water with red mud.

The RMA is the main source area spreading red mud and radionuclides to other parts of the Site via erosion. The red mud stored in the RMA exhibited radionuclide concentrations in excess of the threshold criteria specified for industrial and residential use scenarios. Significant erosion has been observed to occur in the RMA that has resulted in the spread of radiological contaminants to other portions of the Site. The erosion process is on-going and significant erosion during rainfall events were observed during the September 2011 field investigation. The threat of radionuclide transport from the RMA via air (through emissions or particulate migration) has not been fully evaluated; however, prevention of potential windborne or airborne migration of radioactivity should also be a focus of any remediation of the RMA.

The RMB is also a source of red mud and radionuclide migration. Red mud in RMB exhibited radionuclide concentrations in excess of the threshold criteria for industrial and residential use scenarios. The red mud in RMB is mostly covered with caliche (crushed carbonate rock); however, both the northern and southern edges are subject to erosion and release to the on-site surface water drainage pathways. Prevention of the migration of the red mud within the RMB is necessary to mitigate the spread of radioactivity.

The Site drainage complex is significantly impacted with red mud and radionuclides are migrating through this system from north to south. The RMS, which is significantly impacted by erosion from RMA, exhibited radionuclide concentrations in excess of the threshold criteria. The RMA Depositional Area located south of the RMA also exhibited radionuclide concentrations in excess of the threshold criteria specified for industrial and residential use scenarios. The RMA Depositional Area receives red mud runoff from the

RMA and transports it to the UCP and the LCP. The UCP, which is significantly impacted by erosion from the RMA, also exhibited radionuclide concentrations in excess of the threshold criteria. The LCP is threatened and may need further evaluation.



The need for remedial action should be evaluated for each component of the Site drainage system to reduce the radionuclide concentrations and/or prevent radionuclide transport via erosion and surface water runoff.

Long-Term Remedy Should Consider Future Use

The following remedial action objectives were developed to be protective of human health for potential future Site residents (under a future residential use scenario), current and future on-site workers, potential future recreationalists, and trespassers who might have unrestricted access:

- Eliminate or minimize the potential for humans to ingest, come into dermal contact with, or inhale particulates of radioactive constituents or to be exposed to external gamma radiation to achieve the level of protection required by the NCP (1 E-06 to 1 E-04 risk range).
- Conduct baseline and ecological risk assessments to establish site-specific cleanup goals.
- Prevent long-term exposure to thorium- and radium-contaminated material (*i.e.*, soil) with concentrations in excess of 5 pCi/g.
- Prevent exposure to indoor concentrations of radon and thoron gases in excess of 4 pCi/L.
- Prevent groundwater contamination in excess of the MCLs specified in the SDWA (5 pCi/L for the sum of radium, 30 μg/L for total uranium, and 4 mrem/year for beta emitters).
- Keep surface radon and thoron flux to less than 20 pCi/m^2-sec.
- Prevent migration of thorium-contaminated material that could result in the unnecessary and unacceptable human and ecological exposures.

REPORT DATE: MAY 2012

EPA OSC: D. ROSOFF

DRAWING: 10913_Alumina_Table_4_4C.mxd
PATH: P:\SAT2\St. Croix Alumina (1455)\MXD\

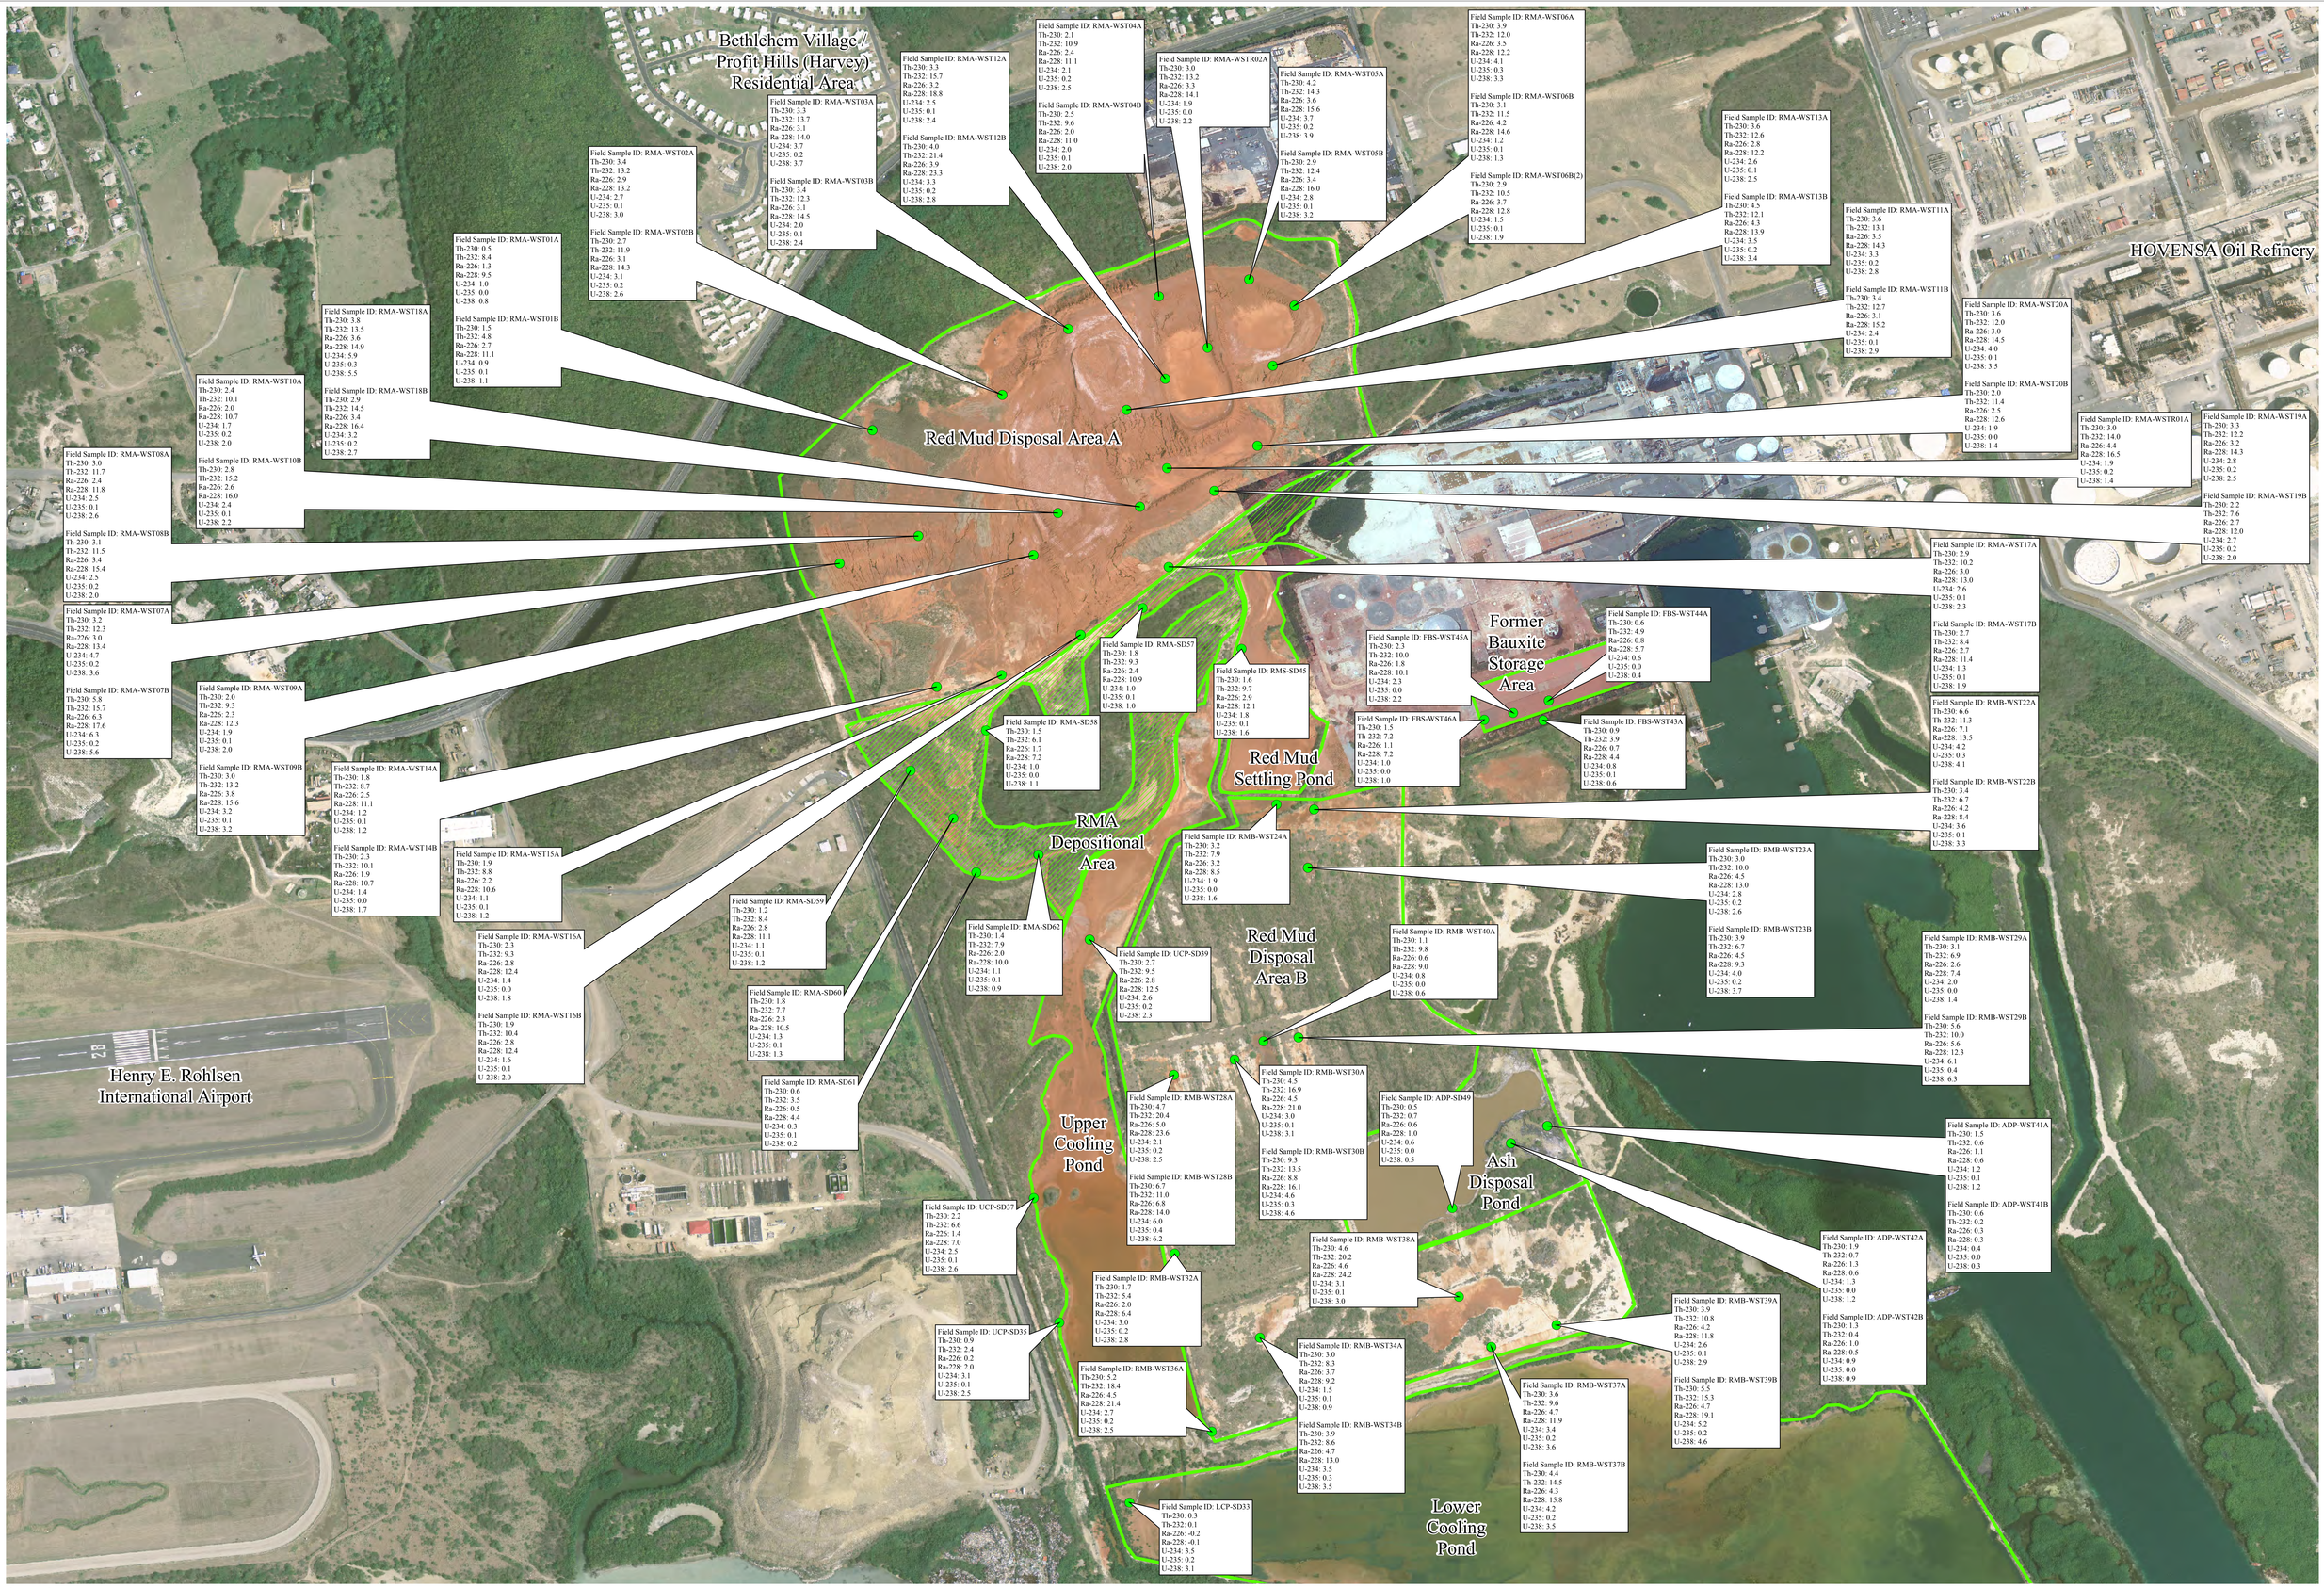
RST SPM: E. KNYFD

REVISION No.: 0

CONTRACT No.: EP-W-06-072

WORK ORDER No.: 20401.132.022.5097

GIS ANALYST: J. TORRES
DATE CREATED: 2/16/2012



CLIENT NAME: UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

PROJECT NAME: ST CROIX ALUMINA SITE

DRAWING TITLE:

FIGURE 8 - RADIOLOGICAL RESULTS OF BACKGROUND SOIL SAMPLES COLLECTED PRIMARILY FROM THE NORTHEAST PORTION OF THE SITE (TABLE 5-3C)

FIGURE: 8 SCALE: 1:3,300 DATE: 3/13/2012

Legend

- Sample Location
- Site Areas
- RMA Depositional Area

Notes

Sample ID Suffix
"A" means a surface sample collected from ground surface to a depth of 2 feet below ground surface;
"B" means a subsurface sample collected from a depth > 2 feet

Results are expressed as pico-Curies per gram (pCi/g)
